Develop your applications quickly and easily with the world's most intuitive mikroC PRO for PIC Microcontrollers.

Highly sophisticated IDE provides the power you need with the simplicity of a Windows based point-and-click environment.

With useful implemented tools, many practical code examples, broad set of built-in routines, and a comprehensive Help, mikroC PRO for PIC makes a fast and reliable tool, which can satisfy needs of experienced engineers and beginners alike.
DISCLAIMER:
mikroC PRO for PIC and this manual are owned by mikroElektronika and are protected by copyright law and international copyright treaty. Therefore, you should treat this manual like any other copyrighted material (e.g., a book). The manual and the compiler may not be copied, partially or as a whole without the written consent from the mikroElektronika. The PDF-edition of the manual can be printed for private or local use, but not for distribution. Modifying the manual or the compiler is strictly prohibited.

HIGH RISK ACTIVITIES:
The mikroC PRO for PIC compiler is not fault-tolerant and is not designed, manufactured or intended for use or resale as on-line control equipment in hazardous environments requiring fail-safe performance, such as in the operation of nuclear facilities, aircraft navigation or communication systems, air traffic control, direct life support machines, or weapons systems, in which the failure of the Software could lead directly to death, personal injury, or severe physical or environmental damage ("High Risk Activities"). mikroElektronika and its suppliers specifically disclaim any express or implied warranty of fitness for High Risk Activities.

LICENSE AGREEMENT:
By using the mikroC PRO for PIC compiler, you agree to the terms of this agreement. Only one person may use licensed version of mikroC PRO for PIC compiler at a time. Copyright © mikroElektronika 2003 - 2009.

This manual covers mikroC PRO for PIC version 1.1 and the related topics. Newer versions may contain changes without prior notice.

COMPILER BUG REPORTS:
The compiler has been carefully tested and debugged. It is, however, not possible to guarantee a 100 % error free product. If you would like to report a bug, please contact us at the address office@mikroe.com. Please include next information in your bug report:
- Your operating system
- Version of mikroC PRO for PIC
- Code sample
- Description of a bug

Introduction to mikroC PRO for PIC

The mikroC PRO for PIC is a powerful, feature-rich development tool for PIC microcontrollers. It is designed to provide the programmer with the easiest possible solution to developing applications for embedded systems, without compromising performance or control.
mikroC PRO for PIC IDE

PIC and C fit together well: PIC is the most popular 8-bit chip in the world, used in a wide variety of applications, and C, prized for its efficiency, is the natural choice for developing embedded systems. *mikroC PRO for PIC* provides a successful match featuring highly advanced IDE, ANSI compliant compiler, broad set of hardware libraries, comprehensive documentation, and plenty of ready-to-run examples.

**Features**

mikroC PRO for PIC allows you to quickly develop and deploy complex applications:

- Write your C source code using the built-in Code Editor (Code and Parameter Assistants, Code Folding, Syntax Highlighting, Auto Correct, Code Templates, and more.)
- Use included *mikroC PRO for PIC* libraries to dramatically speed up the development: data acquisition, memory, displays, conversions, communication etc.
- Monitor your program structure, variables, and functions in the Code Explorer.
- Generate commented, human-readable assembly, and standard HEX compatible with all programmers.
- Use the integrated mikroICD (In-Circuit Debugger) Real-Time debugging tool to...
monitor program execution on the hardware level.
- Inspect program flow and debug executable logic with the integrated Software Simulator.
- Get detailed reports and graphs: RAM and ROM map, code statistics, assembly listing, calling tree, and more.
- *mikroC PRO for PIC* provides plenty of examples to expand, develop, and use as building bricks in your projects. Copy them entirely if you deem fit – that’s why we included them with the compiler.

**Where to Start**

- In case that you’re a beginner in programming PIC microcontrollers, read carefully the PIC Specifics chapter. It might give you some useful pointers on PIC constraints, code portability, and good programming practices.

- If you are experienced in C programming, you will probably want to consult *mikroC PRO for PIC* Specifics first. For language issues, you can always refer to the comprehensive Language Reference. A complete list of included libraries is available at mikroC PRO for PIC Libraries.

- If you are not very experienced in C programming, don’t panic! *mikroC PRO for PIC* provides plenty of examples making it easy for you to go quickly. We suggest that you first consult Projects and Source Files, and then start browsing the examples that you’re the most interested in.
MIKROELEKTRONIKA ASSOCIATES LICENSE STATEMENT AND LIMITED WARRANTY

IMPORTANT - READ CAREFULLY

This license statement and limited warranty constitute a legal agreement ("License Agreement") between you (either as an individual or a single entity) and mikroElektronika ("mikroElektronika Associates") for software product ("Software") identified above, including any software, media, and accompanying on-line or printed documentation.

BY INSTALLING, COPYING, OR OTHERWISE USING SOFTWARE, YOU AGREE TO BE BOUND BY ALL TERMS AND CONDITIONS OF THE LICENSE AGREEMENT.

Upon your acceptance of the terms and conditions of the License Agreement, mikroElektronika Associates grants you the right to use Software in a way provided below.

This Software is owned by mikroElektronika Associates and is protected by copyright law and international copyright treaty. Therefore, you must treat this Software like any other copyright material (e.g., a book).

You may transfer Software and documentation on a permanent basis provided. You retain no copies and the recipient agrees to the terms of the License Agreement. Except as provided in the License Agreement, you may not transfer, rent, lease, lend, copy, modify, translate, sublicense, time-share or electronically transmit or receive Software, media or documentation. You acknowledge that Software in the source code form remains a confidential trade secret of mikroElektronika Associates and therefore you agree not to modify Software or attempt to reverse engineer, decompile, or disassemble it, except and only to the extent that such activity is expressly permitted by applicable law notwithstanding this limitation.

If you have purchased an upgrade version of Software, it constitutes a single product with the mikroElektronika Associates software that you upgraded. You may use the upgrade version of Software only in accordance with the License Agreement.
LIMITED WARRANTY

Respectfully excepting the Redistributables, which are provided “as is”, without warranty of any kind, mikroElektronika Associates warrants that Software, once updated and properly used, will perform substantially in accordance with the accompanying documentation, and Software media will be free from defects in materials and workmanship, for a period of ninety (90) days from the date of receipt. Any implied warranties on Software are limited to ninety (90) days.

mikroElektronika Associates’ and its suppliers’ entire liability and your exclusive remedy shall be, at mikroElektronika Associates’ option, either (a) return of the price paid, or (b) repair or replacement of Software that does not meet mikroElektronika Associates’ Limited Warranty and which is returned to mikroElektronika Associates with a copy of your receipt. DO NOT RETURN ANY PRODUCT UNTIL YOU HAVE CALLED MIKROELEKTRONIKA ASSOCIATES FIRST AND OBTAINED A RETURN AUTHORIZATION NUMBER. This Limited Warranty is void if failure of Software has resulted from an accident, abuse, or misapplication. Any replacement of Software will be warranted for the rest of the original warranty period or thirty (30) days, whichever is longer.

TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, MIKROELEKTRONIKA ASSOCIATES AND ITS SUPPLIERS DISCLAIM ALL OTHER WARRANTIES AND CONDITIONS, EITHER EXPRESSED OR IMPLIED, INCLUDED, BUT NOT LIMITED TO IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, TITLE, AND NON-INFRINGEMENT, WITH REGARD TO SOFTWARE, AND THE PROVISION OF OR FAILURE TO PROVIDE SUPPORT SERVICES.

IN NO EVENT SHALL MIKROELEKTRONIKA ASSOCIATES OR ITS SUPPLIERS BE LIABLE FOR ANY SPECIAL, INCIDENTAL, INDIRECT, OR CONSEQUENTIAL DAMAGES WHATSOEVER (INCLUDING, WITHOUT LIMITATION, DAMAGES FOR LOSS OF BUSINESS PROFITS AND BUSINESS INFORMATION, BUSINESS INTERRUPTION, OR ANY OTHER PECUNIARY LOSS) ARISING OUT OF THE USE OF OR INABILITY TO USE SOFTWARE PRODUCT OR THE PROVISION OF OR FAILURE TO PROVIDE SUPPORT SERVICES, EVEN IF MIKROELEKTRONIKA ASSOCIATES HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. IN ANY CASE, MIKROELEKTRONIKA ASSOCIATES’ ENTIRE LIABILITY UNDER ANY PROVISION OF THIS LICENSE AGREEMENT SHALL BE LIMITED TO THE AMOUNT ACTUALLY PAID BY YOU FOR SOFTWARE PRODUCT PROVIDED, HOWEVER, IF YOU HAVE ENTERED INTO A MIKROELEKTRONIKA ASSOCIATES SUPPORT SERVICES AGREEMENT, MIKROELEKTRONIKA ASSOCIATES’ ENTIRE LIABILITY REGARDING SUPPORT SERVICES SHALL BE GOVERNED BY THE TERMS OF THAT AGREEMENT.
HIGH RISK ACTIVITIES

Software is not fault-tolerant and is not designed, manufactured or intended for use or resale as on-line control equipment in hazardous environments requiring fail-safe performance, such as in the operation of nuclear facilities, aircraft navigation or communication systems, air traffic control, direct life support machines, or weapons systems, in which the failure of Software could lead directly to death, personal injury, or severe physical or environmental damage ("High Risk Activities"). mikroElektronika Associates and its suppliers specifically disclaim any expressed or implied warranty of fitness for High Risk Activities.

GENERAL PROVISIONS

This statement may only be modified in writing signed by you and an authorised officer of mikroElektronika Associates. If any provision of this statement is found void or unenforceable, the remainder will remain valid and enforceable according to its terms. If any remedy provided is determined to have failed for its essential purpose, all limitations of liability and exclusions of damages set forth in the Limited Warranty shall remain in effect.

This statement gives you specific legal rights; you may have others, which vary, from country to country. mikroElektronika Associates reserves all rights not specifically granted in this statement.

TECHNICAL SUPPORT

In case you encounter any problem, you are welcome to our support forums at www.mikroe.com/forum/. Here, you may also find helpful information, hardware tips, and practical code snippets. Your comments and suggestions on future development of the *mikroC PRO for PIC* are always appreciated — feel free to drop a note or two on our Wishlist.

In our Knowledge Base www.mikroe.com/en/kb/ you can find the answers to Frequently Asked Questions and solutions to known problems. If you cannot find the solution to your problem in Knowledge Base then report it to Support Desk www.mikroe.com/en/support/. In this way, we can record and track down bugs more efficiently, which is in our mutual interest. We respond to every bug report and question in a suitable manner, ever improving our technical support.
HOW TO REGISTER

The latest version of the mikroC PRO for PIC is always available for downloading from our website. It is a fully functional software libraries, examples, and comprehensive help included.

The only limitation of the free version is that it cannot generate hex output over 2 KB. Although it might sound restrictive, this margin allows you to develop practical, working applications with no thinking of demo limit. If you intend to develop really complex projects in the mikroC PRO for PIC, then you should consider the possibility of purchasing the license key.

Who Gets the License Key

Buyers of the mikroC PRO for PIC are entitled to the license key. After you have completed the payment procedure, you have an option of registering your mikroC PRO. In this way you can generate hex output without any limitations.

How to Get License Key

After you have completed the payment procedure, start the program. Select Help › How to Register from the drop-down menu or click the How To Register Icon 🔄. Fill out the registration form (figure below), select your distributor, and click the Send button.
This will start your e-mail client with message ready for sending. Review the information you have entered, and add the comment if you deem it necessary. Please, do not modify the subject line.

Upon receiving and verifying your request, we will send the license key to the e-mail address you specified in the form.
After Receiving the License Key

The license key comes as a small autoextracting file – just start it anywhere on your computer in order to activate your copy of compiler and remove the demo limit. You do not need to restart your computer or install any additional components. Also, there is no need to run the mikroC PRO for PIC at the time of activation.

Notes:

- The license key is valid until you format your hard disk. In case you need to format the hard disk, you should request a new activation key.
- Please keep the activation program in a safe place. Every time you upgrade the compiler you should start this program again in order to reactivate the license.
CHAPTER 2

*mikroC PRO for PIC*

Environment

The mikroC PRO for PIC is an user-friendly and intuitive environment.
IDE Overview

- The Code Explorer is at your disposal for easier project management.
- The Project Manager allows multiple project management.
- General project settings can be made in the Project Settings window.
- Library manager enables simple handling of libraries being used in a project.
- The Error Window displays all errors detected during compiling and linking.
- The source-level Software Simulator lets you debug executable logic step-by-step by watching the program flow.
- The New Project Wizard is a fast, reliable, and easy way to create a project.
- Help files are syntax and context sensitive.
- Like in any modern Windows application, you may customize the layout of mikroC PRO for PIC to suit your needs best.
- Spell checker underlines identifiers which are unknown to the project. In this way it helps the programmer to spot potential problems early, much before the project is compiled.
- Spell checker can be disabled by choosing the option in the Preferences dialog (F12).

### Advanced »

<table>
<thead>
<tr>
<th>Advanced</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Comment</td>
<td>Shift+Ctrl+, Comment selected code or put single line comment if there is no selection.</td>
</tr>
<tr>
<td>Uncomment</td>
<td>Shift+Ctrl+, Uncomment selected code or remove single line comment if there is no selection.</td>
</tr>
<tr>
<td>Indent</td>
<td>Shift+Ctrl+I, Indent selected code.</td>
</tr>
<tr>
<td>Outdent</td>
<td>Shift+Ctrl+U, Outdent selected code.</td>
</tr>
<tr>
<td>Lowercase</td>
<td>Ctrl+Alt+L, Changes selected text case to lowercase.</td>
</tr>
<tr>
<td>Uppercase</td>
<td>Ctrl+Alt+U, Changes selected text case to uppercase.</td>
</tr>
<tr>
<td>Titlecase</td>
<td>Ctrl+Alt+T, Changes selected text case to titlercase.</td>
</tr>
</tbody>
</table>

### Find Text

Dialog box for searching the document for the specified text. The search is performed in the direction specified. If the string is not found a message is displayed.
Replace Text

Dialog box for searching for a text string in file and replacing it with another text string.

Find In Files

Dialog box for searching for a text string in current file, all opened files, or in files on a disk.

The string to search for is specified in the Text to find field. If Search in directories option is selected, The files to search are specified in the Files mask and Path fields.
Go To Line

Dialog box that allows the user to specify the line number at which the cursor should be positioned.

Regular expressions option

By checking this box, you will be able to advance your search, through Regular expressions.

TOOLBARS

File Toolbar

File Toolbar is a standard toolbar with following options:

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Opens a new editor window.</td>
</tr>
<tr>
<td></td>
<td>Open source file for editing or image file for viewing.</td>
</tr>
<tr>
<td></td>
<td>Save changes for active window.</td>
</tr>
<tr>
<td></td>
<td>Save changes in all opened windows.</td>
</tr>
<tr>
<td></td>
<td>Close current editor.</td>
</tr>
<tr>
<td></td>
<td>Close all editors.</td>
</tr>
<tr>
<td></td>
<td>Print Preview.</td>
</tr>
</tbody>
</table>

Edit Toolbar

Edit Toolbar is a standard toolbar with following options:

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Undo last change.</td>
</tr>
<tr>
<td></td>
<td>Redo last change.</td>
</tr>
<tr>
<td></td>
<td>Cut selected text to clipboard.</td>
</tr>
<tr>
<td></td>
<td>Copy selected text to clipboard.</td>
</tr>
<tr>
<td></td>
<td>Paste text from clipboard.</td>
</tr>
</tbody>
</table>
Advanced Edit Toolbar

Advanced Edit Toolbar comes with following options:

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>{...}</td>
<td>Comment selected code or put single line comment if there is no selection</td>
</tr>
<tr>
<td>{...}</td>
<td>Uncomment selected code or remove single line comment if there is no selection.</td>
</tr>
<tr>
<td>BEGIN END</td>
<td>Select text from starting delimiter to ending delimiter.</td>
</tr>
<tr>
<td>BEGIN END</td>
<td>Go to ending delimiter.</td>
</tr>
<tr>
<td></td>
<td>Go to line.</td>
</tr>
<tr>
<td></td>
<td>Indent selected code lines.</td>
</tr>
<tr>
<td></td>
<td>Outdent selected code lines.</td>
</tr>
<tr>
<td>HTML</td>
<td>Generate HTML code suitable for publishing current source code on the web.</td>
</tr>
</tbody>
</table>

Find/Replace Toolbar

Find/Replace Toolbar is a standard toolbar with following options:

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Find text in current editor.</td>
</tr>
<tr>
<td></td>
<td>Find next occurrence.</td>
</tr>
<tr>
<td></td>
<td>Find previous occurrence.</td>
</tr>
<tr>
<td></td>
<td>Replace text.</td>
</tr>
<tr>
<td></td>
<td>Find text in files.</td>
</tr>
</tbody>
</table>
### Project Toolbar

Project Toolbar comes with following options:

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="New project" /></td>
<td>New project</td>
</tr>
<tr>
<td><img src="image" alt="Open Project" /></td>
<td>Open Project</td>
</tr>
<tr>
<td><img src="image" alt="Save Project" /></td>
<td>Save Project</td>
</tr>
<tr>
<td><img src="image" alt="Close current project" /></td>
<td>Close current project.</td>
</tr>
<tr>
<td><img src="image" alt="Edit project settings" /></td>
<td>Edit project settings.</td>
</tr>
<tr>
<td><img src="image" alt="Add existing project to project group" /></td>
<td>Add existing project to project group.</td>
</tr>
<tr>
<td><img src="image" alt="Remove existing project from project group" /></td>
<td>Remove existing project from project group.</td>
</tr>
<tr>
<td><img src="image" alt="Add File To Project" /></td>
<td>Add File To Project</td>
</tr>
<tr>
<td><img src="image" alt="Remove File From Project" /></td>
<td>Remove File From Project</td>
</tr>
</tbody>
</table>

### Build Toolbar

Build Toolbar comes with the following options:

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Build current project" /></td>
<td>Build current project.</td>
</tr>
<tr>
<td><img src="image" alt="Build all opened projects" /></td>
<td>Build all opened projects.</td>
</tr>
<tr>
<td><img src="image" alt="Build and program active project" /></td>
<td>Build and program active project.</td>
</tr>
<tr>
<td><img src="image" alt="Start programmer and load current HEX file" /></td>
<td>Start programmer and load current HEX file.</td>
</tr>
<tr>
<td><img src="image" alt="Open assembly code in editor" /></td>
<td>Open assembly code in editor.</td>
</tr>
<tr>
<td><img src="image" alt="Open listing file in editor" /></td>
<td>Open listing file in editor.</td>
</tr>
<tr>
<td><img src="image" alt="View statistics for current project" /></td>
<td>View statistics for current project.</td>
</tr>
</tbody>
</table>
**Debugger**

Debugger Toolbar comes with following options:

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Start Software Simulator or mikroICD (In-Circuit Debugger)." /></td>
<td>Start Software Simulator or mikroICD (In-Circuit Debugger).</td>
</tr>
<tr>
<td><img src="image" alt="Run/Pause debugger." /></td>
<td>Run/Pause debugger.</td>
</tr>
<tr>
<td><img src="image" alt="Stop debugger." /></td>
<td>Stop debugger.</td>
</tr>
<tr>
<td><img src="image" alt="Step into." /></td>
<td>Step into.</td>
</tr>
<tr>
<td><img src="image" alt="Step over." /></td>
<td>Step over.</td>
</tr>
<tr>
<td><img src="image" alt="Step out." /></td>
<td>Step out.</td>
</tr>
<tr>
<td><img src="image" alt="Run to cursor." /></td>
<td>Run to cursor.</td>
</tr>
<tr>
<td><img src="image" alt="Toggle breakpoint." /></td>
<td>Toggle breakpoint.</td>
</tr>
<tr>
<td><img src="image" alt="Toggle breakpoints." /></td>
<td>Toggle breakpoints.</td>
</tr>
<tr>
<td><img src="image" alt="Clear breakpoints." /></td>
<td>Clear breakpoints.</td>
</tr>
<tr>
<td><img src="image" alt="View watch window" /></td>
<td>View watch window</td>
</tr>
<tr>
<td><img src="image" alt="View stopwatch window" /></td>
<td>View stopwatch window</td>
</tr>
</tbody>
</table>

**Styles Toolbar**

Styles toolbar allows you to easily customize your workspace.
Tools Toolbar

The Tools toolbar comes with following default options:

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>📱</td>
<td>Run USART Terminal</td>
</tr>
<tr>
<td>📚</td>
<td>EEPROM</td>
</tr>
<tr>
<td>📡</td>
<td>ASCII Chart</td>
</tr>
<tr>
<td>📝</td>
<td>Seven segment decoder tool.</td>
</tr>
<tr>
<td>☑</td>
<td>Options menu</td>
</tr>
</tbody>
</table>

The Tools toolbar can easily be customized by adding new tools in Options (F12) window.

IDE OVERVIEW

The *mikroC PRO for PIC* is an user-friendly and intuitive environment:

- The Code Explorer is at your disposal for easier project management.
- The Project Manager allows multiple project management.
- General project settings can be made in the Project Settings window.
- Library manager enables simple handling libraries being used in a project.
- The Error Window displays all errors detected during compiling and linking.
- The source-level Software Simulator lets you debug executable logic step-by-step by watching the program flow.
- The New Project Wizard is a fast, reliable, and easy way to create a project.
- Help files are syntax and context sensitive.
- Like in any modern Windows application, you may customize the layout of *mikroC PRO for PIC* to suit your needs best.
- Spell checker underlines identifiers which are unknown to the project. In this way it helps the programmer to spot potential problems early, much before the project is compiled. Spell checker can be disabled by choosing the option in the Preferences dialog (F12).
CUSTOMIZING IDE LAYOUT

Docking Windows

You can increase the viewing and editing space for code, depending on how you arrange the windows in the IDE.

Step 1: Click the window you want to dock, to give it focus.

Step 2: Drag the tool window from its current location. A guide diamond appears. The four arrows of the diamond point towards the four edges of the IDE.
Step 3: Move the pointer over the corresponding portion of the guide diamond. An outline of the window appears in the designated area.

Step 4: To dock the window in the position indicated, release the mouse button.

Tip: To move a dockable window without snapping it into place, press CTRL while dragging it.

Saving Layout

Once you have a window layout that you like, you can save the layout by typing the name for the layout and pressing the Save Layout Icon .

To set the layout select the desired layout from the layout drop-down list and click the Set Layout Icon .

To remove the layout from the drop-down list, select the desired layout from the list and click the Delete Layout Icon .
Auto Hide

Auto Hide enables you to see more of your code at one time by minimizing tool windows along the edges of the IDE when not in use.

- Click the window you want to keep visible to give it focus.
- Click the Pushpin Icon on the title bar of the window.

When an auto-hidden window loses focus, it automatically slides back to its tab on the edge of the IDE. While a window is auto-hidden, its name and icon are visible on a tab at the edge of the IDE. To display an auto-hidden window, move your pointer over the tab. The window slides back into view and is ready for use.
ADVANCED CODE EDITOR

The Code Editor is advanced text editor fashioned to satisfy needs of professionals. General code editing is the same as working with any standard text-editor, including familiar Copy, Paste and Undo actions, common for Windows environment.

Advanced Editor Features

- Adjustable Syntax Highlighting
- Code Assistant
- Code Folding
- Parameter Assistant
- Code Templates (Auto Complete)
- Auto Correct for common typos
- Spell Checker
- Bookmarks and Goto Line
- Comment / Uncomment

You can configure the Syntax Highlighting, Code Templates and Auto Correct from the Editor Settings dialog. To access the Settings, click Tools › Options from the drop-down menu, click the Show Options Icon or press F12 key.
**Code Assistant**

If you type the first few letters of a word and then press **Ctrl+Space**, all valid identifiers matching the letters you have typed will be prompted in a floating panel (see the image below). Now you can keep typing to narrow the choice, or you can select one from the list using the keyboard arrows and **Enter**.

![Code Assistant Image]

**Code Folding**

Code folding is IDE feature which allows users to selectively hide and display sections of a source file. In this way it is easier to manage large regions of code within one window, while still viewing only those subsections of the code that are relevant during a particular editing session.

While typing, the code folding symbol (- and +) appear automatically. Use the folding symbols to hide/unhide the code subsections.

```c
void main()
{
    PORTA = 0;
    PORTB = 0;
    Lcd_Init();
    LCD_Out(1,1,txt[0]);
    LCD_Out(2,1,txt[1]);
    delay_ms(1000);
    Lcd_Cmd(1);

    LCD_Out(1,1,txt[1]);
    LCD_Out(2,4,txt[2]);
    delay_ms(500);
}
```

If you place a mouse cursor over the tooltip box, the collapsed text will be shown in a tooltip style box.
Parameter Assistant

The Parameter Assistant will be automatically invoked when you open parenthesis “(” or press Shift+Ctrl+Space. If the name of a valid function precedes the parenthesis, then the expected parameters will be displayed in a floating panel. As you type the actual parameter, the next expected parameter will become bold.

Code Templates (Auto Complete)

You can insert the Code Template by typing the name of the template (for instance, whiles), then press Ctrl+J and the Code Editor will automatically generate a code.

You can add your own templates to the list. Select Tools > Options from the drop-down menu, or click the Show Options Icon and then select the Auto Complete Tab. Here you can enter the appropriate keyword, description and code of your template.

Autocomplete macros can retrieve system and project information:

- %DATE% - current system date
- %TIME% - current system time
- %DEVICE% - device(MCU) name as specified in project settings
- %DEVICE_CLOCK% - clock as specified in project settings
- %COMPILER% - current compiler version
These macros can be used in template code, see template `ptemplate` provided with `mikroC PRO for PIC` installation.

**Auto Correct**

The Auto Correct feature corrects common typing mistakes. To access the list of recognized typos, select **Tools › Options** from the drop-down menu, or click the Show Options Icon and then select the Auto Correct Tab. You can also add your own preferences to the list.

Also, the Code Editor has a feature to comment or uncomment the selected code by simple click of a mouse, using the Comment Icon and Uncomment Icon from the Code Toolbar.

**Spell Checker**

The Spell Checker underlines unknown objects in the code, so they can be easily noticed and corrected before compiling your project.

Select **Tools › Options** from the drop-down menu, or click the Show Options Icon and then select the Spell Checker Tab.

**Bookmarks**

Bookmarks make navigation through a large code easier. To set a bookmark, use `Ctrl+Shift+number`. To jump to a bookmark, use `Ctrl+number`.

**Goto Line**

The Goto Line option makes navigation through a large code easier. Use the shortcut `Ctrl+G` to activate this option.

**Comment / Uncomment**

Also, the Code Editor has a feature to comment or uncomment the selected code by simple click of a mouse, using the Comment Icon and Uncomment Icon from the Code Toolbar.
CODE EXPLORER

The Code Explorer gives clear view of each item declared inside the source code. You can jump to a declaration of any item by right clicking it. Also, besides the list of defined and declared objects, code explorer displays message about first error and it's location in code.

Following options are available in the Code Explorer:

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1.png" alt="Expand/Collapse" /></td>
<td>Expand/Collapse all nodes in tree.</td>
</tr>
<tr>
<td><img src="image2.png" alt="Locate declaration" /></td>
<td>Locate declaration in code.</td>
</tr>
</tbody>
</table>
ROUTINE LIST

Routine list displays list of routines, and enables filtering routines by name. Routine list window can be accessed by pressing Ctrl+L.

You can jump to a desired routine by double clicking on it.
PROJECT MANAGER

Project Manager is IDE feature which allows users to manage multiple projects. Several projects which together make project group may be open at the same time. Only one of them may be active at the moment. Setting project in **active** mode is performed by **double click** on the desired project in the Project Manager.

![Project Manager](image)

Following options are available in the Project Manager:
<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1" alt="Save project Group." /></td>
<td>Save project Group.</td>

PROJECT SETTINGS WINDOW

Following options are available in the Project Settings Window:

- Device - select the appropriate device from the device drop-down list.
- Oscillator - enter the oscillator frequency value.
- Build/Debugger Type - choose debugger type.

Related topics: Edit Project, Customizing Projects
LIBRARY MANAGER

Library Manager enables simple handling libraries being used in a project. Library Manager window lists all libraries (extension .mcl) which are instantly stored in the compiler Uses folder. The desirable library is added to the project by selecting check box next to the library name.

In order to have all library functions accessible, simply press the button Check All and all libraries will be selected. In case none library is needed in a project, press the button Clear All and all libraries will be cleared from the project.

Only the selected libraries will be linked.

ERROR WINDOW

In case that errors were encountered during compiling, the compiler will report them and won’t generate a hex file. The Error Window will be prompted at the bottom of the main window by default.

The Error Window is located under message tab, and displays location and type of errors the compiler has encountered. The compiler also reports warnings, but these do not affect the output; only errors can interfere with the generation of hex.

Double click the message line in the Error Window to highlight the line where the error was encountered.

Related topics: Error Messages
STATISTICS

After successful compilation, you can review statistics of your code. Click the Statistics Icon.

Memory Usage Windows

Provides overview of RAM and ROM usage in the various forms.

RAM Memory Usage

Displays RAM memory usage in a pie-like form.
**Used RAM Locations**
Displays used RAM memory locations and their names.

**SFR Locations**
Displays list of used SFR locations.
ROM Memory Usage
Displays ROM memory space usage in a pie-like form.

ROM Memory Constants
Displays ROM memory constants and their addresses.
**Function Sorted by Name**
Sorts and displays functions by their addresses, symbolic names, and unique assembler names.

**Functions Sorted by Size**
Sorts and displays functions by their size, in the ascending order.
Functions Sorted by Addresses
Sorts and displays functions by their addresses, in the ascending order.

Functions Sorted by Name Chart
Sorts and displays functions by their names in a chart-like form.
Functions Sorted by Size Chart
Sorts and displays functions by their sizes in a chart-like form.

Functions sorted by Address Chart
Sorts and displays functions by their addresses in a chart-like form.
Function Tree
Displays Function Tree with the relevant data for each function.

Memory Summary
Displays summary of RAM and ROM memory in a pie-like form.
MACRO EDITOR

A macro is a series of keystrokes that have been 'recorded' in the order performed. A macro allows you to 'record' a series of keystrokes and then 'playback', or repeat, the recorded keystrokes.

The Macro offers the following commands:

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>🎁</td>
<td>Starts 'recording' keystrokes for later playback.</td>
</tr>
<tr>
<td>🎁</td>
<td>Stops capturing keystrokes that was started when the Start Recording command was selected.</td>
</tr>
<tr>
<td>🎁</td>
<td>Allows a macro that has been recorded to be replayed.</td>
</tr>
<tr>
<td>🎁</td>
<td>New macro.</td>
</tr>
<tr>
<td>🎁</td>
<td>Delete macro.</td>
</tr>
</tbody>
</table>

INTEGRATED TOOLS

USART Terminal

The *mikroC PRO for PIC* includes the USART communication terminal for RS232 communication. You can launch it from the drop-down menu *Tools › USART Terminal* or by clicking the USART Terminal Icon from Tools toolbar.

![USART Terminal Image](image-url)
EEPROM Editor

The EEPROM Editor is used for manipulating MCU's EEPROM memory. You can launch it from the drop-down menu Tools › EEPROM Editor. When Use this EEPROM definition is checked compiler will generate Intel hex file project_name.ihex that contains data from EEPROM editor.

When you run mikroElektronika programmer software from mikroC PRO for PIC IDE - project_name.hex file will be loaded automatically while ihex file must be loaded manually.
ASCII Chart

The ASCII Chart is a handy tool, particularly useful when working with Lcd display. You can launch it from the drop-down menu Tools › ASCII chart or by clicking the View ASCII Chart Icon from Tools toolbar.
**Seven Segment Converter**

The Seven Segment Convertor is a convenient visual panel which returns decimal/hex value for any viable combination you would like to display on 7seg. Click on the parts of 7 segment image to get the requested value in the edit boxes. You can launch it from the drop-down menu **Tools › 7 Segment Convertor** or by clicking the Seven Segment Convertor Icon from Tools toolbar.

![Seven Segment Editor](image)

**LCD Custom Character**

mikroC PRO for PIC includes the Lcd Custom Character. Output is mikroC PRO for PIC compatible code. You can launch it from the drop-down menu **Tools › Lcd Custom Character**.
Graphic LCD Bitmap Editor

The *mikroC PRO for PIC* includes the Graphic Lcd Bitmap Editor. Output is the mikroC PRO for PIC compatible code. You can launch it from the drop-down menu **Tools › Glcd Bitmap Editor**.
**HID Terminal**

The *mikroC PRO for PIC* includes the HID communication terminal for USB communication. You can launch it from the drop-down menu **Tools › HID Terminal**.
UDP Terminal

The *mikroC PRO for PIC* includes the UDP Terminal. You can launch it from the drop-down menu **Tools › UDP Terminal**.
mikroBootloader

(From Microchip's document AN732) The PIC16F87X family of microcontrollers has the ability to write to their own program memory. This feature allows a small bootloader program to receive and write new firmware into memory. In its most simple form, the bootloader starts the user code running, unless it finds that new firmware should be downloaded. If there is new firmware to be downloaded, it gets the data and writes it into program memory. There are many variations and additional features that can be added to improve reliability and simplify the use of the bootloader.

Note: mikroBootloader can be used only with PIC MCUs that support flash write.

How to use mikroBootloader?

1. Load the PIC with the appropriate hex file using the conventional programming techniques (e.g. for PIC16F877A use p16f877a.hex).
2. Start mikroBootloader from the drop-down menu Tools › Bootloader.
3. Click on Setup Port and select the COM port that will be used. Make sure that BAUD is set to 9600 Kbps.
4. Click on Open File and select the HEX file you would like to upload.
5. Since the bootcode in the PIC only gives the computer 4-5 sec to connect, you should reset the PIC and then click on the Connect button within 4-5 seconds.
6. The last line in then history window should now read “Connected”.
7. To start the upload, just click on the Start Bootloader button.
8. Your program will written to the PIC flash. Bootloader will report an errors that may occur.
9. Reset your PIC and start to execute.
Features

The boot code gives the computer 5 seconds to get connected to it. If not, it starts running the existing user code. If there is a new user code to be downloaded, the boot code receives and writes the data into program memory.

The more common features a bootloader may have are listed below:

- Code at the Reset location.
- Code elsewhere in a small area of memory.
- Checks to see if the user wants new user code to be loaded.
- Starts execution of the user code if no new user code is to be loaded.
- Receives new user code via a communication channel if code is to be loaded.
- Programs the new user code into memory.

Integrating User Code and Boot Code

The boot code almost always uses the Reset location and some additional program memory. It is a simple piece of code that does not need to use interrupts; therefore, the user code can use the normal interrupt vector at 0x0004. The boot code must avoid using the interrupt vector, so it should have a program branch in the address range 0x0000 to 0x0003. The boot code must be programmed into memory using conventional programming techniques, and the configuration bits must be programmed at this time. The boot code is unable to access the configuration bits, since they are not mapped into the program memory space.
OPTIONS

Options menu consists of three tabs: Code Editor, Tools and Output settings.

Code editor

The Code Editor is advanced text editor fashioned to satisfy needs of professionals.

Tools

The *mikroC PRO for PIC* includes the Tools tab, which enables the use of shortcuts to external programs, like Calculator or Notepad.

You can set up to 10 different shortcuts, by editing Tool0 - Tool9.
Output settings

By modifying Output Settings, user can configure the content of the output files. You can enable or disable, for example, generation of ASM and List file. Also, user can choose optimization level, and compiler specific settings, which include case sensitivity, dynamic link for string literals setting (described in *mikroC PRO for PIC* specifics).

Build all files as library enables user to use compiled library (*.mcl) on any PIC MCU (when this box is checked), or for a selected PIC MCU (when this box is left unchecked).

For more information on creating new libraries, see Creating New Library.
REGULAR EXPRESSIONS

Introduction

Regular Expressions are a widely-used method of specifying patterns of text to search for. Special metacharacters allow you to specify, for instance, that a particular string you are looking for, occurs at the beginning, or end of a line, or contains n recurrences of a certain character.

Simple matches

Any single character matches itself, unless it is a metacharacter with a special meaning described below. A series of characters matches that series of characters in the target string, so the pattern "short" would match "short" in the target string. You can cause characters that normally function as metacharacters or escape sequences to be interpreted by preceding them with a backslash "\". 
For instance, metacharacter "^" matches beginning of string, but "\^" matches character "^", and "\" matches "\", etc.

Examples:

unsigned matches string 'unsigned'
\^unsigned matches string '^[unsigned]

Escape sequences

Characters may be specified using a escape sequences: "\n" matches a newline, "\t" a tab, etc. More generally, \xnn, where nn is a string of hexadecimal digits, matches the character whose ASCII value is nn.
If you need wide (Unicode) character code, you can use '\x{nnnn}', where 'nnnn' - one or more hexadecimal digits.

\xnn - char with hex code nn
\x{nnnn} - char with hex code nnnn (one byte for plain text and two bytes for Unicode)
\t - tab (HT/TAB), same as \x09
\n - newline (NL), same as \x0a
\r - car.return (CR), same as \x0d
\f - form feed (FF), same as \x0c
\a - alarm (bell) (BEL), same as \x07
\e - escape (ESC), same as \x1b
Examples:

\texttt{unsigned int} matches 'unsigned int' (note space in the middle)
\texttt{\textbackslash t unsigned} matches 'unsigned' (preceeded by tab)

**Character classes**

You can specify a character class, by enclosing a list of characters in [], which will match any of the characters from the list. If the first character after the "[" is "^", the class matches any character not in the list.

Examples:

\texttt{count[aeiou]r} finds strings 'countar', 'counter', etc. but not
'countbr', 'countcr', etc.
\texttt{count[^aeiou]r} finds strings 'countbr', 'countcr', etc. but not
'countar', 'counter', etc.

Within a list, the "-" character is used to specify a range, so that a-z represents all characters between "a" and "z", inclusive.

If you want "-" itself to be a member of a class, put it at the start or end of the list, or precede it with a backslash.
If you want ']', you may place it at the start of list or precede it with a backslash.

Examples:

\texttt{[-az]} matches 'a', 'z' and '-'
\texttt{[az-]} matches 'a', 'z' and '-'
\texttt{[a\-z]} matches 'a', 'z' and '-'
\texttt{[a-z]} matches all twenty six small characters from 'a' to 'z'
\texttt{[\n-\x0D]} matches any of #10, #11, #12, #13.
\texttt{[\d-t]} matches any digit, '-' or 't'.
\texttt{[\]-a]} matches any char from ']'..'a'.

**Metacharacters**

Metacharacters are special characters which are the essence of regular expressions. There are different types of metacharacters, described below.
Metacharacters - Line separators

- ^ - start of line
- $ - end of line
- \A - start of text
- \Z - end of text
- . - any character in line

Examples:

- ^PORTA - matches string 'PORTA' only if it's at the beginning of line
- PORTA$ - matches string 'PORTA' only if it's at the end of line
- ^PORTA$ - matches string 'PORTA' only if it's the only string in line
- PORT.r - matches strings like 'PORTA', 'PORTB', 'PORT1' and so on

The "^" metacharacter by default is only guaranteed to match beginning of the input string/text, and the "$" metacharacter only at the end. Embedded line separators will not be matched by "^" or "$".
You may, however, wish to treat a string as a multi-line buffer, such that the "^" will match after any line separator within the string, and "$" will match before any line separator.
Regular expressions works with line separators as recommended at http://www.unicode.org/unicode/reports/tr18/

Metacharacters - Predefined classes

- \w - an alphanumeric character (including "_."
- \W - a nonalphanumeric character
- \d - a numeric character
- \D - a non-numeric character
- \s - any space (same as [\t\n\r\f])
- \S - a non space

You may use \w, \d and \s within custom character classes.

Example:

- routi\de - matches strings like 'routine', 'routine' and so on, but not 'routine', 'routine' and so on.
Metacharacters - Word boundaries

A word boundary ("\b") is a spot between two characters that has an alphanumeric character ("\w") on one side, and a nonalphanumeric character ("\W") on the other side (in either order), counting the imaginary characters off the beginning and end of the string as matching a "\W".

- \b - match a word boundary
- \B - match a non-(word boundary)

Metacharacters - Iterators

Any item of a regular expression may be followed by another type of metacharacters - iterators. Using this metacharacters, you can specify number of occurrences of previous character, metacharacter or subexpression.

*  - zero or more ("greedy"), similar to {0,}
+  - one or more ("greedy"), similar to {1,}
?  - zero or one ("greedy"), similar to {0,1}
{n} - exactly n times ("greedy")
{n,} - at least n times ("greedy")
{n,m} - at least n but not more than m times ("greedy")
*? - zero or more ("non-greedy"), similar to {0,}?  
+? - one or more ("non-greedy"), similar to {1,}?  
?? - zero or one ("non-greedy"), similar to {0,1}?  
{n}? - exactly n times ("non-greedy")
{n,}? - at least n times ("non-greedy")
{n,m}? - at least n but not more than m times ("non-greedy")

So, digits in curly brackets of the form, \{n,m\}, specify the minimum number of times to match the item \n and the maximum \m. The form \{n\} is equivalent to \{n,n\} and matches exactly \n times. The form \{n,\} matches \n or more times. There is no limit to the size of \n or \m, but large numbers will chew up more memory and slow down execution.

So, digits in curly brackets of the form, \{n,m\}, specify the minimum number of times to match the item \n and the maximum \m. The form \{n\} is equivalent to \{n,n\} and matches exactly \n times. The form \{n,\} matches \n or more times. There is no limit to the size of \n or \m, but large numbers will chew up more memory and slow down execution.

If a curly bracket occurs in any other context, it is treated as a regular character.
Examples:

```
count.*r  β- matches strings like 'counter', 'countelkjdflk9jr' and 'countr'
count.+r  - matches strings like 'counter', 'countelkjdflk9jr' but not 'countr'
count.?r  - matches strings like 'counter', 'countar' and 'countr' but not 'countelk9jr'
counte{2}r - matches string 'counteer'
counte{2,}r - matches strings like 'counteer', 'counteeer', 'counteeer' etc.
counte{2,3}r - matches strings like 'counteer', or 'counteer' but not 'counteeer'
```

A little explanation about "greediness". "Greedy" takes as many as possible, "non-greedy" takes as few as possible.
For example, 'b+' and 'b*' applied to string 'abbbbc' return 'bbbb', 'b+?' returns 'b', 'b*?' returns empty string, 'b{2,3}?' returns 'bb', 'b{2,3}' returns 'bbb'.

**Metacharacters - Alternatives**

You can specify a series of alternatives for a pattern using "|" to separate them, so that bit|bat|bot will match any of "bit", "bat", or "bot" in the target string as would "b(i|a|o)t)". The first alternative includes everything from the last pattern delimiter ("(" or "]") or the beginning of the pattern) up to the first "|", and the last alternative contains everything from the last "|" to the next pattern delimiter. For this reason, it's common practice to include alternatives in parentheses, to minimize confusion about where they start and end.

Alternatives are tried from left to right, so the first alternative found for which the entire expression matches, is the one that is chosen. This means that alternatives are not necessarily greedy. For example: when matching rou|rout against "rou-tine", only the "rou" part will match, as that is the first alternative tried, and it successfully matches the target string (this might not seem important, but it is important when you are capturing matched text using parentheses). Also remember that "|" is interpreted as a literal within square brackets, so if you write [bit|bat|bot], you're really only matching [biao|].

Examples:

```
rou(tine|te) - matches strings 'routine' or 'route'.
```
**Metacharacters - Subexpressions**

The bracketing construct ( ... ) may also be used for define regular subexpressions. Subexpressions are numbered based on the left to right order of their opening parenthesis. First subexpression has number '1'.

**Examples:**

\[(\text{int})\{8,10\}\] matches strings which contain 8, 9 or 10 instances of the 'int'
\[\text{routi}([0-9]|a+)e\] matches 'routi0e', 'routile', 'routine', 'routinne', 'routinnne' etc.

**Metacharacters - Backreferences**

Metacharacters \1 through \9 are interpreted as backreferences. \ matches previously matched subexpression #.

**Examples:**

\[(\.)\1+\] matches 'aaaa' and 'cc'.
\[(\.+\)\1+\] matches 'abab' and '123123'
\[(\['"]\?)\(\d+\)\1\] matches "13" (in double quotes), or '4' (in single quotes) or 77 (without quotes) etc.
**mikroC PRO for PIC COMMAND LINE OPTIONS**

Usage: `mikroCPIC1618.exe [-<opts> [-<opts>]] [<infile> [-<opts>]] [-<opts>]]

Infile can be of *.c, *.mcl and *.pld type.

The following parameters and some more (see manual) are valid:
- **-P**: MCU for which compilation will be done.
- **-FO**: Set oscillator [in MHz].
- **-SP**: Add directory to the search path list.
- **-IF**: Add directory to the #include search list.
- **-N**: Output files generated to file path specified by filename.
- **-B**: Save compiled binary files (*.mcl) to 'directory'.
- **-O**: Miscellaneous output options.
- **-DBG**: Generate debug info.
- **-L**: Check and rebuild new libraries.
- **-D**: Build all files as libraries.
- **-Y**: Dynamic link for string literals.
- **-C**: Turn on case sensitivity.
- **-UCD**: ICD build type.

**Example:**
```
mikroCPIC1618.exe -MSF -DBG -p16F887 -ES -C -011111114 -fo8 -N"C:\Lcd\Lcd.mcppi" -SP"C:\Program Files\Mikroelektro\mikroC PRO for PIC\Defs" -SP"C:\Program Files\Mikroelektro\mikroC PRO for PIC\Uses\P16" -SP"C:\Lcd\" "Lcd.c" "__Lib_Math.mcl" "__Lib_MathDouble.mcl" "__Lib_System.mcl" "__Lib_Delays.mcl" "__Lib_LcdConsts.mcl" "__Lib_Lcd.mcl"
```

Parameters used in the example:
- **MSF**: Short Message Format; used for internal purposes by IDE.
- **DBG**: Generate debug info.
- **p16F887**: MCU 16F887 selected.
- **C**: Turn on case sensitivity.
- **011111114**: Miscellaneous output options.
- **fo8**: Set oscillator frequency [in MHz].
- **N"C:\Lcd\Lcd.mcppi"**: Output files generated to file path specified by filename.
- **-SP"C:\Program Files\Mikroelektro\mikroC PRO for PIC\Defs\"**: Add directory to the search path list.
- **SP"C:\Program Files\Mikroelektro\mikroC PRO for PIC\Uses\"**: Add directory to the search path list.
- **SP"C:\Lcd\"**: Add directory to the search path list.
- **Lcd.c" "__Lib_Math.mcl" "__Lib_MathDouble.mcl" "__Lib_System.mcl" "__Lib_Delays.mcl" "__Lib_LcdConsts.mcl" "__Lib_Lcd.mcl"**: Specify input files.
PROJECTS

The mikroC PRO for PIC organizes applications into projects, consisting of a single project file (extension .mcppi) and one or more source files (extension .c). mikroC PRO for PIC IDE allows you to manage multiple projects (see Project Manager). Source files can be compiled only if they are part of a project.

The project file contains the following information:

- project name and optional description,
- target device,
- device flags (config word),
- device clock,
- list of the project source files with paths,
- header files (*.h),
- binary files (*.mcl),
- image files,
- other files.

Note that the project does not include files in the same way as preprocessor does, see Add/Remove Files from Project.

New Project

The easiest way to create a project is by means of the New Project Wizard, dropdown menu Project › New Project or by clicking the New Project Icon from Project Toolbar.
New Project Wizard Steps

Start creating your New project, by clicking Next button:

Step One - Select the device from the device drop-down list.
**Step Two** - Enter the oscillator frequency value.

**Step Three** - Specify the location where your project will be saved.
Step Four - Add project file to the project if they are available at this point. You can always add project files later using Project Manager.

Step Five - Click Finish button to create your New Project.

CUSTOMIZING PROJECTS

Edit Project

You can change basic project settings in the Project Settings window. You can change chip, and oscillator frequency. Any change in the Project Setting Window affects currently active project only, so in case more than one project is open, you have to ensure that exactly the desired project is set as active one in the Project Manager. Also, you can change configuration bits of the selected chip in the Edit Project window.

Managing Project Group

*mikroC PRO for PIC IDE* provides convenient option which enables several projects to be open simultaneously. If you have several projects being connected in some way, you can create a project group.

The project group may be saved by clicking the Save Project Group Icon from the Project Manager window. The project group may be reopend by clicking the Open Project Group Icon . All relevant data about the project group is stored in the project group file (extension .mpgroup)

Add/Remove Files from Project

The project can contain the following file types:

- source files
- .h header files
- .mcl binary files
- .pld project level defines files
- image files
  - .hex, .asm and .lst files, see output files. These files can not be added or removed from project.
- other files
The list of relevant source files is stored in the project file (extension `.mcppi`).

To add source file to the project, click the Add File to Project Icon . Each added source file must be self-contained, i.e. it must have all necessary definitions after preprocessing.

To remove file(s) from the project, click the Remove File from Project Icon .

**Project Level Defines:**

Project Level Defines (.pld) files can also be added to project. Project level define files enable you to have defines that are visible in all source files in the project. A file must contain one definition per line in the following form:

```
<symbol>[ = [ <value> ] ]
<symbol (a,b)>[ = [ <value> ] ]
```

Define a macro named symbol. To specify a value, use `=<value>`. If `=<value>` is omitted, 1 is assumed. Do not enter white-space characters immediately before the `=`. If a white-space character is entered immediately after the `=`, the macro is defined as zero token. This option can be specified repeatedly. Each appearance of symbol will be replaced by the value before compilation.

There are two predefined project level defines. See predefined project level defines [Note: For inclusion of the header files (extension `.h`), use the preprocessor directive `#include`. See File Inclusion for more information.]

Related topics: Project Manager, Project Settings, Edit Project
SOURCE FILES

Source files containing C code should have the extension `. The list of source files relevant to the application is stored in project file with extension `.mcppi`, along with other project information. You can compile source files only if they are part of the project.

Use the preprocessor directive `#include` to include header files with the extension `.h`. Do not rely on the preprocessor to include source files other than headers — see Add/Remove Files from Project for more information.

Managing Source Files

Creating new source file

To create a new source file, do the following:
1. Select File › New Unit from the drop-down menu, or press Ctrl+N, or click the New File Icon from the File Toolbar.
2. A new tab will be opened. This is a new source file. Select File › Save from the drop-down menu, or press Ctrl+S, or click the Save File Icon from the File Toolbar and name it as you want.

If you use the New Project Wizard, an empty source file, named after the project with extension, will be created automatically. The mikroC PRO for PIC does not require you to have a source file named the same as the project, it’s just a matter of convenience.

Opening an existing file

1. Select File › Open from the drop-down menu, or press Ctrl+O, or click the Open File Icon from the File Toolbar. In Open Dialog browse to the location of the file that you want to open, select it and click the Open button.
2. The selected file is displayed in its own tab. If the selected file is already open, its current Editor tab will become active.

Printing an open file

1. Make sure that the window containing the file that you want to print is active.
2. Select File › Print from the drop-down menu, or press Ctrl+P.
3. In the Print Preview Window, set a desired layout of the document and click the OK button. The file will be printed on the selected printer.
Saving file

1. Make sure that the window containing the file that you want to save is active.
2. Select File › Save from the drop-down menu, or press Ctrl+S, or click the Save File Icon from the File Toolbar.

Saving file under a different name

1. Make sure that the window containing the file that you want to save is active.
2. Select File › Save As from the drop-down menu. The New File Name dialog will be displayed.
3. In the dialog, browse to the folder where you want to save the file.
4. In the File Name field, modify the name of the file you want to save.
5. Click the Save button.

Closing file

1. Make sure that the tab containing the file that you want to close is the active tab.
2. Select File › Close from the drop-down menu, or right click the tab of the file that you want to close and select Close option from the context menu.
3. If the file has been changed since it was last saved, you will be prompted to save your changes.

Related topics: File Menu, File Toolbar, Project Manager, Project Settings,
CLEAN PROJECT FOLDER

This menu gives you option to choose which files from your current project you want to delete.
Files marked in bold can be easily recreated by building a project. Other files should be marked for deletion only with a great care, because IDE cannot recover them.

Related topics: Customizing Projects
**COMPILATION**

When you have created the project and written the source code, it's time to compile it. Select **Project › Build** from the drop-down menu, or click the Build Icon from the Project Toolbar. If more than one project is open you can compile all open projects by selecting **Project › Build All** from the drop-down menu, or click the Build All Icon from the Project Toolbar.

Progress bar will appear to inform you about the status of compiling. If there are some errors, you will be notified in the Error Window. If no errors are encountered, the *mikroC PRO for PIC* will generate output files.

**Output Files**

Upon successful compilation, the *mikroC PRO for PIC* will generate output files in the project folder (folder which contains the project file *.mcppi*). Output files are summarized in the table below:

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
<th>File Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Intel HEX</td>
<td>Intel style hex records. Use this file to program PIC MCU.</td>
<td>.hex</td>
</tr>
<tr>
<td>Binary</td>
<td>mikro Compiled Library. Binary distribution of application that can be included in other projects.</td>
<td>.mcl</td>
</tr>
<tr>
<td>List File</td>
<td>Overview of PIC memory allotment: instruction addresses, registers, routines and labels.</td>
<td>.lst</td>
</tr>
<tr>
<td>Assembler File</td>
<td>Human readable assembly with symbolic names, extracted from the List File.</td>
<td>.asm</td>
</tr>
</tbody>
</table>

**Assembly View**

After compiling the program in the *mikroC PRO for PIC*, you can click the View Assembly icon or select **Project › View Assembly** from the drop-down menu to review the generated assembly code (*.asm file) in a new tab window. Assembly is human-readable with symbolic names.

ERROR MESSAGES

Compiler Error Messages:

- Syntax error: Expected [ %s ] but [ %s ] found
- Array element cannot be function
- Function cannot return array
- Inconsistent storage class
- Inconsistent type
- [ %s ] tag redefined [ %s ]
- Illegal typecast [ %s ] [ %s ]
- "%s" is not valid identifier
- Invalid statement
- Constant expression required
- Internal error [ %s ]
- Too many actual parameters
- Not enough parameters.
- Invalid expression
- Identifier expected, but [ %s ] found
- Operator [ %s ] is not applicable to these operands [ %s ]
- Assigning to non-lvalue [ %s ]
- Cannot cast [ %s ] to [ %s ]
- Cannot assign [ %s ] to [ %s ]
- Lvalue required
- Pointer required
- Argument is out of range
- Undeclared identifier [ %s ] in expression
- Too many initializers
- Cannot establish this baud rate at [ %s ] MHz clock
- Stack overflow
- Invalid operator [ %s ]
- Expected variable, but constant [ %s ] found
- Expected constant, but [ %s ] found
- [ %s ] cannot be used outside a loop
- Unknown type [ %s ]
- Variable [ %s ] is redeclared
- Undeclared identifier [ %s ]
- Output limit has raised 2K words
- [ %s ] has already been declared [ %s ]
- Type mismatch: expected [ %s ], but [ %s ] found
- File [ %s ] not found [ %s ]
- There is not enough RAM space for all variables
- There is not enough ROM space
- Invalid type in Array
- Division by zero
- Incompatible types: [ %s ] [ %s ]
- Too many characters
- Assembler instruction [ %s] was not found
- Project name must be specified
- Unknown command line Option: [ %s]
- File extension missing: [ %s]
- Bad FO argument: [ %s]
- Preprocessor exited with error code [ %s]
- Bad absolute address [ %s]
- Recursion or cross-calling of [ %s]
- Reentrancy is not allowed: function [ %s] called from two threads
- no files specified
- Device parameter missing (for example -P16F...)
- Invalid parameter string
- Project name must be set
- Specifier needed
- [ %s] not found [ %s]
- Index out of bounds
- Array dimension must be greater than 0
- Const expression expected
- Integer const expected
- Recursion in definition
- Array corrupted
- Arguments cannot be of void type
- Arguments cannot have explicit memory specifierator
- Bad storage class
- Pointer to function required
- Function required
- Illegal pointer conversion to double
- Integer type needed
- Members cannot have memory specifierator
- Members cannot be of bit or sbit type
- Too many initializers
- Too many initializers of subaggregate
- Already used [ %s]
- Illegal expression with void
- Address must be greater than 0
- [ %s] Identifier redefined
- User abort
- Expression must be greater than 0
- Invalid declarator expected "(" or identifier
- typedef name redefined: [ %s]
- Declarator error
- Specifier/qualifier list expected
- [ %s] already used
- ILevel can be used only with interrupt service routines
- ; expected, but [ %s] found
- Expected "{'
- [%s] Identifier redefined
- "(" expected, but [%s] found
- ")" expected, but [%s] found
- "case" out of switch
- ":" expected, but [%s] found
- "default" label out of switch
- switch expression must evaluate to integral type
- while expected, but [%s] found
- void func cannot return values
- "continue" outside of loop
- Unreachable code
- Label redefined
- void type in expression
- Too many chars
- Unresolved type
- Arrays of objects containing zero-size arrays are illegal
- ILevel can be used only with interrupt service routines
- ILevel value must be integral constant
- ILevel out of range "0..4"
- ")" expected [%s] found
- ")" expected, but [%s] found
- "break" outside of loop or switch
- Empty char
- Nonexistent field [%s]
- Illegal char representation: [%s]
- Initializer syntax error: multidimensional array missing subscript
- Too many initializers of subaggregate
- At least one Search Path must be specified
- Not enough RAM for call stack
- Demo Limit
- Parameter [%s] must not be of bit or sbit type
- Function must not have return value of bit or sbit type
Compiler Warning Messages:

- Bad or missing fosc parameter. Default value 8MHz used
- Specified search path does not exist: [ %s]
- Specified include path does not exist: [ %s]
- Result is not defined in function: [ %s]
- Initialization of extern object [ %s]
- Suspicious pointer conversion
- Implicit conversion of pointer to int
- Unknown pragma line ignored: [ %s]
- Implicit conversion of int to ptr
- Generated baud rate is[ %s] bps (error = [ %s] percent)
- Unknown memory model [ %s], small memory model used instead
- IRP bit must be set manually for indirect access to [ %s] variable
- Variable [ %s] has been declared, but not used'
- Illegal file type: [ %s]

Linker Error Messages:

- Redefinition of [ %s] already defined in [ %s]
- main function is not defined
- System routine is not found for initialization of: [ %s]
- Bad aggregate definition [ %s]
- Unresolved extern [ %s]
- Bad function absolute address [ %s]
- Not enough RAM [ %s]
SOFTWARE SIMULATOR OVERVIEW

The Source-level Software Simulator is an integral component of the mikroC PRO for PIC environment. It is designed to simulate operations of the PIC MCUs and assist the users in debugging C code written for these devices. Upon completion of writing your program, choose Release build Type in the Project Settings window:

![Project Settings Window]

Choose Release type if you want to use software simulator

After you have successfully compiled your project, you can run the Software Simulator by selecting Run › Start Debugger from the drop-down menu, or by clicking the Start Debugger Icon from the Debugger Toolbar. Starting the Software Simulator makes more options available: Step Into, Step Over, Step Out, Run to Cursor, etc. Line that is to be executed is color highlighted (blue by default).

Note: The Software Simulator simulates the program flow and execution of instruction lines, but it cannot fully emulate PIC device behavior, i.e. it doesn't update timers, interrupt flags, etc.
Breakpoints Window

The Breakpoints window manages the list of currently set breakpoints in the project. Doubleclicking the desired breakpoint will cause cursor to navigate to the corresponding location in source code.

![Breakpoints Window]

Watch Window

The Software Simulator Watch Window is the main Software Simulator window which allows you to monitor program items while simulating your program. To show the Watch Window, select View › Debug Windows › Watch from the drop-down menu.

The Watch Window displays variables and registers of the MCU, along with their addresses and values.

There are two ways of adding variable/register to the watch list:

- by its real name (variable's name in "C" code). Just select desired variable/register from Select variable from list drop-down menu and click the Add Button.
- by its name ID (assembly variable name). Simply type name ID of they variable/register you want to display into Search the variable by assembly name box and click the Add Button.
Variables can also be removed from the Watch window, just select the variable that you want to remove and then click the Remove Button. Add All Button adds all variables. Remove All Button removes all variables.

You can also expand/collapse complex variables, i.e. struct type variables, strings... Values are updated as you go through the simulation. Recently changed items are colored red.

Double clicking a variable or clicking the Properties Button opens the Edit Value window in which you can assign a new value to the selected variable/register. Also, you can choose the format of variable/register representation between decimal, hexadecimal, binary, float or character. All representations except float are unsigned by default. For signed representation click the check box next to the Signed label.
An item's value can be also changed by double clicking item's value field and typing the new value directly.

View RAM Window

Debugger View RAM Window is available from the drop-down menu, View › Debug Windows › View RAM.

The View RAM Window displays the map of PIC’s RAM, with recently changed items colored red.
**Stopwatch Window**

The Software Simulator Stopwatch Window is available from the drop-down menu, *View › Debug Windows › Stopwatch*.

The Stopwatch Window displays a current count of cycles/time since the last Software Simulator action. *Stopwatch* measures the execution time (number of cycles) from the moment Software Simulator has started and can be reset at any time. *Delta* represents the number of cycles between the lines where Software Simulator action has started and ended.

**Note**: The user can change the clock in the Stopwatch Window, which will recalculate values for the latest specified frequency. Changing the clock in the Stopwatch Window does not affect actual project settings – it only provides a simulation.
## SOFTWARE SIMULATOR OPTIONS

CREATING NEW LIBRARY

*mikroC PRO for PIC* allows you to create your own libraries. In order to create a library in *mikroC PRO for PIC* follow the steps below:

1. Create a new C source file, see Managing Source Files

2. Save the file in one of the subfolders of the compiler's Uses folder:
   
   DriveName:\Program Files\Mikroelektronika\mikroC PRO for PIC\Uses\P16\ 
   DriveName:\Program Files\Mikroelektronika\mikroC PRO for PIC\Uses\P18\ 
   
   If you are creating library for PIC16 MCU family the file should be saved in P16 folder.
   If you are creating library for PIC18 MCU family the file should be saved in P18 fodler. 
   If you are creating library for PIC16 and PIC18 MCU families the file should be 
   saved in both folders.

3. Write a code for your library and save it.

4. Add `__Lib_Example` file in some project, see Project Manager. Recompile the project.
   
   If you wish to use this library for all MCUs, then you should go to Tools › Options › Output settings, and check Build all files as library box. 
   This will build libraries in a common form which will work with all MCUs. If this box is not checked, then library will be built for selected MCU. 
   Bear in mind that compiler will report an error if a library built for specific MCU is used for another one.

5. Compiled file `__Lib_Example.mcl` should appear in ...\mikroC PRO for PIC\Uses\ folder.

6. Open the definition file for the MCU that you want to use. This file is placed in the compiler's Defs folder:

   DriveName:\Program Files\Mikroelektronika\mikroC PRO for PIC\Defs\ 
   
   and it is named `MCU_NAME.mlk`, for example `16F887.mlk`

7. Add the the following segment of code to `<LIBRARIES>` node of the definition file (definition file is in XML format):

   `<LIB>
   <ALIAS>Example_Library</ALIAS>
   <FILE>__Lib_Example</FILE>
   <TYPE>REGULAR</TYPE>`
8. Add Library to mlk file for each MCU that you want to use with your library.

9. Click Refresh button in Library Manager

**Multiple Library Versions**

Library Alias represents unique name that is linked to corresponding Library .mcl file. For example UART library for 16F887 is different from UART library for 18F4520 MCU. Therefore, two different UART Library versions were made, see mlk files for these two MCUs. Note that these two libraries have the same Library Alias (UART) in both mlk files. This approach enables you to have identical representation of UART library for both MCUs in Library Manager.

Related topics: Library Manager, Project Manager, Managing Source Files
mikroICD is highly effective tool for **Real-Time debugging** on hardware level. ICD debugger enables you to execute a *mikroC PRO for PIC* program on a host PIC microcontroller and view variable values, Special Function Registers (SFR), memory and EEPROM as the program is running.
Step No. 1

If you have appropriate hardware and software for using mikroICD, then, upon completion of writing your program, you will have to choose **ICD Debug** build type.

![Project Settings](image)

Choose ICD Debug type if you want to use mikroICD debug.

Step No. 2

You can run the mikroICD by selecting **Run › Debug** from the drop-down menu, or by clicking Debug Icon ![Debug Icon](image). Starting the Debugger makes more options available: Step Into, Step Over, Run to Cursor, etc. Line that is to be executed is color highlighted (blue by default). There is also notification about program execution and it can be found on Watch Window (yellow status bar). Note that some functions take time to execute, so running of program is indicated on Watch Window.
### mikroICD Debugger Options

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Function Key</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>Start Debugger.</td>
<td>[F9]</td>

<td>Run or pause Debugger.</td>
<td>[F6]</td>
</tr>
<tr>
<td>Toggle Breakpoints</td>
<td>Toggle breakpoint at the current cursor position. To view all breakpoints, select Run &gt; View Breakpoints from the drop-down menu. Double clicking an item in the Breakpoints Window List locates the breakpoint.</td>
<td>[F5]</td>
</tr>
<tr>
<td>Run to cursor</td>
<td>Execute all instructions between the current instruction and cursor position.</td>
<td>[F4]</td>
</tr>
<tr>
<td>Step Into</td>
<td>Execute the current C (single or multi-cycle) instruction, then halt. If the instruction is a routine call, enter the routine and halt at the first instruction following the call.</td>
<td>[F7]</td>
</tr>
<tr>
<td>Step Over</td>
<td>Execute the current C (single or multi-cycle) instruction, then halt. If the instruction is a routine call, skip it and halt at the first instruction following the call.</td>
<td>[F8]</td>
</tr>
<tr>
<td>Flush RAM</td>
<td>Flush current PIC RAM. All variable values will be changed according to values from watch window.</td>
<td>N/A</td>
</tr>
<tr>
<td>Disassembly View</td>
<td>Toggle between disassembly and C source view.</td>
<td>[Alt+D]</td>
</tr>
</tbody>
</table>
mikroICD Debugger Examples

Here is a step by step mikroICD Debugger Example.

**Step No.1**

First you have to write a program. We will show how mikroICD works using this example:

```c
// LCD module connections
sbit LCD_RS at RB4_bit;
sbit LCD_EN at RB5_bit;
sbit LCD_D4 at RB0_bit;
sbit LCD_D5 at RB1_bit;
sbit LCD_D6 at RB2_bit;
sbit LCD_D7 at RB3_bit;

sbit LCD_RS_Direction at TRISB4_bit;
sbit LCD_EN_Direction at TRISB5_bit;
sbit LCD_D4_Direction at TRISB0_bit;
sbit LCD_D5_Direction at TRISB1_bit;
sbit LCD_D6_Direction at TRISB2_bit;
sbit LCD_D7_Direction at TRISB3_bit;
// End LCD module connections

char text[17] = "mikroElektronika";
char i;

void main(){
    PORTB = 0;
    TRISB = 0;
    ANSEL = 0;
    ANSELH = 0;

    Lcd_Init();
    Lcd_Cmd(_LCD_CLEAR);
    Lcd_Cmd(_LCD_CURSOR_OFF);

    for(i = 1; i < 17; i++) {
        Lcd_Chr(1, i, text[i-1]);
    }
}
```
Step No. 2

After successful compilation and PIC programming press **F9** for starting mikroICD. After mikroICD initialization blue active line should appear:

```c
void main()
{
    PORTB = 0;
    TRISB = 0;
    ANSEL = 0;
    ANSELH = 0;

    Lcd_Init();
    Lcd_Cmd(LCD_CLEAR);
    Lcd_Cmd(LCD_CURSOR_OFF);

    for(i = 1; i < 17; i++) {
        Lcd_Ch(r, i, text[i-1]);
    }
}
```

Step No. 3

We will debug program line by line. Pressing **F8** we are executing code line by line. It is recommended that user does not use Step Into [F7] and Step Over [F8] over Delays routines and routines containing delays. Instead use Run to cursor [F4] and Breakpoints functions.

All changes are read from PIC and loaded into Watch Window. Note that **PORTB**, **TRISB**, **ANSEL** and **ANSELH** changed its values. 255 to 0.
Step No. 4

Step Into [F7] and Step Over [F8] are mikroICD debugger functions that are used in stepping mode. There is also Real-Time mode supported by mikroICD. Functions that are used in Real-Time mode are Run/ Pause Debugger [F6] and Run to cursor [F4]. Pressing F4 goes to line selected by user. User just have to select line with cursor and press F4, and code will be executed until selected line is reached.

Step No. 5

Run(Pause) Debugger [F6] and Toggle Breakpoints [F5] are mikroICD debugger functions that are used in Real-Time mode. Pressing F5 marks line selected by user for breakpoint. F6 executes code until breakpoint is reached. After reaching breakpoint Debugger halts. Here at our example we will use breakpoints for writing "mikroElektronika" on Lcd char by char. Breakpoint is set on Lcd_Chr and program will stop everytime this function is reached. After reaching breakpoint we must press F6 again for continuing program execution.
Breakpoints have been separated into two groups. There are hardware and software breakpoints. Hardware breakpoints are placed in PIC and they provide fastest debug. Number of hardware breakpoints is limited (1 for P16 and 1 or 3 for P18). If all hardware breakpoints are used, next breakpoints that will be used are software breakpoints. Those breakpoints are placed inside mikroICD, and they simulate hardware breakpoints. Software breakpoints are much slower than hardware breakpoints. This difference between hardware and software differences are not visible in mikroICD software but their different timings are quite notable, so it is important to know that there are two types of breakpoints.
mikroICD (In-Circuit Debugger) Overview

Breakpoints Window

The Breakpoints window manages the list of currently set breakpoints in the project. Doubleclicking the desired breakpoint will cause cursor to navigate to the corresponding location in source code.
**Watch Window**

Debugger Watch Window is the main Debugger window which allows you to monitor program items while running your program. To show the Watch Window, select View › Debug Windows › Watch Window from the drop-down menu.

The Watch Window displays variables and registers of PIC, with their addresses and values. Values are updated as you go through the simulation. Use the drop-down menu to add and remove the items that you want to monitor. Recently changed items are colored red.
Double clicking an item opens the Edit Value window in which you can assign a new value to the selected variable/register. Also, you can change view to binary, hex, char, or decimal for the selected item.

EEPROM Watch Window

mikroICD EEPROM Watch Window is available from the drop-down menu, View › Debug Windows › View EEPROM.

The EEPROM Watch window shows current values written into PIC internal EEPROM memory. There are two action buttons concerning EEPROM Watch window - Write EEPROM and Read EEPROM. Write EEPROM writes data from EEPROM Watch window into PIC internal EEPROM memory. Read EEPROM reads data from PIC internal EEPROM memory and loads it up in EEPROM window.
Code Watch Window

mikroICD Code Watch Window is available from the drop-down menu, View › Debug Windows › View Code.

The Code Watch window shows code (hex code) written into PIC. There is action button concerning Code Watch window - Read Code. Read Code reads code from PIC and loads it up in View Code Window.
Also, you can set an address scope in which hex code will be read.
**View RAM Memory**

Debugger View RAM Window is available from the drop-down menu, View › Debug Windows › View RAM.

The View RAM Window displays the map of PIC’s RAM, with recently changed items colored red.

**Common Errors**

- Trying to program PIC while mikroICD is active.
- Trying to debug **Release** build Type version of program.
- Trying to debug changed program code which hasn't been compiled and programmed into PIC.
- Trying to select line that is empty for Run to cursor [F4] and Toggle Breakpoints [F5] functions.
- Trying to debug PIC with mikroICD while Watch Dog Timer is enabled.
- Trying to debug PIC with mikroICD while Power Up Timer is enabled.
- It is not possible to force Code Protect while trying to debug PIC with mikroICD.
- Trying to debug PIC with mikroICD with pull-up resistors set to ON on RB6 and RB7.
- For correct mikroICD debugging do not use pull-ups.
MIKROICD ADVANCED BREAKPOINTS

mikroICD provides the possibility to use the Advanced Breakpoints. Advanced Breakpoints can be used with PIC18 and PIC18FJ MCUs. To enable Advanced Breakpoints set the Advanced Breakpoints checkbox inside Watch window:

![Advanced Breakpoints]

To configure Advanced Breakpoints, start mikroICD [F9] and select View › Debug Windows › Advanced Breakpoints option from the drop-down menu or use [Ctrl+Shift+A] shortcut.

![Advanced Breakpoints Configuration Window]

**Note:** When Advanced Breakpoints are enabled mikroICD operates in Real-Time mode, so it will support only the following set of commands: Start Debugger [F9], Run/Pause Debugger [F6] and Stop Debugger [Ctrl+F2]. Once the Advanced Breakpoint is reached, the Advanced Breakpoints feature can be disabled and mikroICD debugging can be continued with full set of commands. If needed, Advanced Breakpoints can be re-enabled without restarting mikroICD.

**Note:** Number of Advanced Breakpoints is equal to number of Hardware breakpoints and it depends on used MCU.
**Program Memory Break**

Program Memory Break is used to set the Advanced Breakpoint to the specific address in program memory. Because of PIC pipelining mechanism program execution may stop one or two instructions after the address entered in the Address field. Value entered in the Address field must be in hex format.

**Note:** Program Memory Break can use the Passcount option. The program execution will stop when the specified program address is reached for the N-th time, where N is the number entered in the Passcount field. When some Advanced Breakpoint stops the program execution, passcount counters for all Advanced Breakpoints will be cleared.

**Program Memory Break**

Program Memory Break is used to set the Advanced Breakpoint to the specific address in program memory. Because of PIC pipelining mechanism program execution may stop one or two instructions after the address entered in the Address field. Value entered in the Address field must be in hex format.

**Note:** Program Memory Break can use the Passcount option. The program execution will stop when the specified program address is reached for the N-th time, where N is the number entered in the Passcount field. When some Advanced Breakpoint stops the program execution, passcount counters for all Advanced Breakpoints will be cleared.

**File Register Break**

File Register Break can be used to stop the code execution when read/write access to the specific data memory location occurs. If Read Access is selected, the File Register Equal option can be used to set the matching value. The program execution will be stopped when the value read from the specified data memory location is equal to the number written in the Value field. Values entered in the Address and Value fields must be in hex format.

**Note:** File Register Break can also use the Passcount option in the same way as Program Memory Break.
Emulator Features

Event Breakpoints

- **Break on Stack Overflow/Underflow**: not implemented.
- **Break on Watchdog Timer**: not implemented.
- **Break on SLEEP**: break on SLEEP instruction. SLEEP instruction will not be executed. If you choose to continue the mikroICD debugging [F6] then the program execution will start from the first instruction following the SLEEP instruction.

Stopwatch

Stopwatch uses Breakpoint#2 and Breakpoint#3 as a Start and Stop conditions. To use the Stopwatch define these two Breakpoints and check the **Enable Stopwatch** checkbox.

Stopwatch options:

Halt on Start Condition

- **Halt on Start Condition (Breakpoint#2)**: when checked, the program execution will stop on Breakpoint#2. Otherwise, Breakpoint#2 will be used only to start the Stopwatch.
- **Halt on Stop Condition (Breakpoint#3)**: when checked, the program execution will stop on Breakpoint#3. Otherwise, Breakpoint#3 will be used only to stop the Stopwatch.
- **Reset Stopwatch on Run**: when checked, the Stopwatch will be cleared before continuing program execution and the next counting will start from zero. Otherwise, the next counting will start from the previous Stopwatch value.
The following topics cover the specifics of mikroC PRO for PIC compiler:

- ANSI Standard Issues
- Predefined Globals and Constants
- Accessing Individual Bits
- Interrupts
- PIC Pointers
- Linker Directives
- Built-in Routines
- Code Optimization
- Memory Type Specifiers
ANSI Standard Issues

Divergence from the ANSI C Standard

- Tentative declarations are not supported.

C Language Extensions

*mikroC PRO for PIC* has additional set of keywords that do not belong to the ANSI standard C language keywords:

- code
- data
- rx
- at
- sbit
- bit
- sfr

Related topics: Keywords, PIC Specific

Predefined Globals and Constants

To facilitate programming of PIC compliant MCUs, the *mikroC PRO for PIC* implements a number of predefined globals and constants.

All PIC SFR registers and their bits are implicitly declared as global variables. These identifiers have an external linkage, and are visible in the entire project. When creating a project, the *mikroC PRO for PIC* will include an appropriate (*.*) file from defs folder, containing declarations of available SFR registers and constants.

For a complete set of predefined globals and constants, look for “Defs” in the *mikroC PRO for PIC* installation folder, or probe the Code Assistant for specific letters (Ctrl+Space in the Code Editor).
Predefined project level defines

There are four predefined project level defines for any project you make. These defines are based on values that you have entered/edited in the current project:

- First one is equal to the name of selected device for the project i.e. if 16F887 is selected device, then 16F887 token will be defined as 1, so it can be used for conditional compilation:
  ```c
  #ifdef P16F887
  ...
  #endif
  ```
- The second one is __FOSC__ value of frequency (in Khz) for which the project is built.
- Third one is for identifying mikroC PRO for PIC compiler:
  ```c
  #ifdef __MIKROC_PRO_FOR_PIC__
  ...
  #endif
  ```
- Fourth one is for identifying the build version. For instance, if a desired build version is 142, user should put this in his code:
  ```c
  #if __MIKROC_PRO_FOR_PIC_BUILD__ == 142
  ...
  #endif
  ```

User can define custom project level defines.

Accessing Individual Bits

The mikroC PRO for PIC allows you to access individual bits of 8-bit variables. It also supports sbit and bit data types.

Accessing Individual Bits Of Variables

If you are familiar with a particular MCU, you can access bits by name:

```c
// Clear Global Interrupt Bit (GIE)
GIE_bit = 0;
```

Also, you can simply use the direct member selector (.) with a variable, followed by one of identifiers B0, B1, ..., B7, or F0, F1, ... F7, with F7 being the most significant bit:

```c
// Clear bit 0 in INTCON register
INTCON.B0 = 0;
// Set bit 5 in ADCON0 register
ADCON0.F5 = 1;
```
There is no need of any special declarations. This kind of selective access is an intrinsic feature of *mikroC PRO for PIC* and can be used anywhere in the code. Identifiers \texttt{B0–B7} are not case sensitive and have a specific namespace. You may override them with your own members \texttt{B0–B7} within any given structure.

See Predefined Globals and Constants for more information on register/bit names.

**Note:** If aiming at portability, avoid this style of accessing individual bits, use the bit fields instead.

### sbit type

The *mikroC PRO for PIC* compiler has sbit data type which provides access to bit-addressable SFRs. You can access them in the following manner:

```c
sbit LEDA at PORTA.B0;
sbit bit_name at sfr-name.B<bit-position>;

sbit LEDB at PORTB.F0;
sbit bit_name at sfr-name.F<bit-position>;

// If you are familiar with a particular MCU and its ports and direction registers (TRIS), you can access bits by their names:
sbit LEDC at RC0_bit;
sbit bit_name at R<port-letter><bit-position>_bit;

sbit TRISC0 at TRISC0_bit;
sbit bit_name at TRIS<port-letter><bit-position>_bit;
```

### bit type

The *mikroC PRO for PIC* compiler provides a bit data type that may be used for variable declarations. It can not be used for argument lists, and function-return values.

```c
bit bf;      // bit variable
```

There are no pointers to bit variables:

```c
bit* ptr;    // invalid
```

An array of type bit is not valid:

```c
bit arr[5];        // invalid
```
Note:

- Bit variables can not be initialized.
- Bit variables can not be members of structures and unions.
- Bit variables do not have addresses, therefore unary operator & (address of) is not applicable to these variables.

Related topics: Bit fields, Predefined globals and constants

**Interrupts**

Interrupts can be easily handled by means of reserved word `interrupt`. *mikroC PRO for PIC* implicitly declares function `interrupt` which cannot be redeclared. Its prototype is:

```c
void interrupt(void);
```

For P18 low priority interrupts reserved word is `interrupt_low`:

```c
void interrupt_low(void);
```

You are expected to write your own definition (function body) to handle interrupts in your application.

*mikroC PRO for PIC* saves the following SFR on stack when entering interrupt and pops them back upon return:

- PIC12 family: `W, STATUS, FSR, PCLATH`
- PIC16 family: `W, STATUS, FSR, PCLATH`
- PIC18 family: `FSR` (fast context is used to save `WREG, STATUS, BSR`)

Use the `#pragma disablecontextsaving` to instruct the compiler not to automatically perform context-switching. This means that no register will be saved/restored by the compiler on entrance/exit from interrupt service routine. This enables the user to manually write code for saving registers upon entrance and to restore them before exit from interrupt.
**P18 priority interrupts**

**Note:** For the P18 family both low and high interrupts are supported.

1. function with name `interrupt` will be linked as ISR (interrupt service routine) for high level interrupt
2. function with name `interrupt_low` will be linked as ISR for low level interrupt

If interrupt priority feature is to be used then the user should set the appropriate SFR bits to enable it. For more information refer to datasheet for specific device.

**Function Calls from Interrupt**

Calling functions from within the interrupt() routine is now possible. The compiler takes care about the registers being used, both in "interrupt" and in "main" thread, and performs "smart" context-switching between the two, saving only the registers that have been used in both threads. Check functions reentrancy.

**Interrupt Examples**

Here is a simple example of handling the interrupts from TMR0 (if no other interrupts are allowed):

```c
void interrupt() {
    counter++;
    TMR0 = 96;
    INTCON = $20;
}
```

In case of multiple interrupts enabled, you need to test which of the interrupts occurred and then proceed with the appropriate code (interrupt handling):

```c
void interrupt() {
    if (INTCON.TMR0IF) {
        counter++;
        TMR0 = 96;
        INTCON.TMR0IF = 0;
    }
    else if (INTCON.RBIF) {
        counter++;
        TMR0 = 96;
        INTCON.RBIF = 0;
    }
}
```
Linker Directives

The mikroC PRO uses an internal algorithm to distribute objects within memory. If you need to have a variable or routine at specific predefined address, use the linker directives `absolute` and `org`.

**Directive absolute**

Directive `absolute` specifies the starting address in RAM for a variable. If the variable is multi-byte, higher bytes will be stored at the consecutive locations.

Directive `absolute` is appended to declaration of a variable:

```c
short x absolute 0x22;
// Variable x will occupy 1 byte at address 0x22

int y absolute 0x23;
// Variable y will occupy 2 bytes at addresses 0x23 and 0x24
```

Be careful when using the absolute directive, as you may overlap two variables by accident. For example:

```c
char i absolute 0x33;
// Variable i will occupy 1 byte at address 0x33

long jjjj absolute 0x30;
// Variable will occupy 4 bytes at 0x30, 0x31, 0x32, 0x33; thus,
// changing i changes jjjj highest byte at the same time, and vice versa
```

**Directive org**

Directive `org` specifies a starting address of a routine in ROM.

Directive `org` is appended to the function definition. Directives applied to non-defining declarations will be ignored, with an appropriate warning issued by the linker.

Here is a simple example:

```c
void func(int par) org 0x200 {
    // Function will start at address 0x200
    asm nop;
}
```

It is possible to use org directive with functions that are defined externally (such as library functions). Simply add org directive to function declaration:
void UART_Write1(char data) org 0x200;

**Note:** Directive `org` can be applied to any routine except for interrupt.

**Directive orgall**

If the user wants to place his routines, constants, etc, above a specified address in ROM, `#pragma orgall` directive should be used:

```
#pragma orgall 0x200
```

**Directive funcorg**

You can use the `#pragma funcorg` directive to specify the starting address of a routine in ROM using routine name only:

```
#pragma funcorg <func_name>  <starting_address>
```

Related topics: Indirect Function Calls

**Indirect Function Calls**

If the linker encounters an indirect function call (by a pointer to function), it assumes that any of the functions addresses of which were taken anywhere in the program, can be called at that point. Use the `#pragma funcall` directive to instruct the linker which functions can be called indirectly from the current function:

```
#pragma funcall <func_name> <called_func>[, <called_func>,...]
```

A corresponding pragma must be placed in the source module where the function `func_name` is implemented. This module must also include declarations of all functions listed in the `called_func` list.

These functions will be linked if the function `func_name` is called in the code no matter whether any of them was called or not.

**Note:** The `#pragma funcall` directive can help the linker to optimize function frame allocation in the compiled stack.

Related topics: Linker Directives
**Built-in Routines**

*mikroC PRO for PIC* compiler provides a set of useful built-in utility functions. Built-in functions do not require any header files to be included; you can use them in any part of your project.

Built-in routines are implemented as “inline”; i.e. code is generated in the place of the call, so the call doesn’t count against the nested call limit. The only exceptions are `Vdelay_ms`, `Delay_Cyc` and `Get_Fosc_kHz` which are actual C routines.

**Note:** `Lo`, `Hi`, `Higher` and `Highest` functions are not implemented in compiler any more. If you want to use these functions you must include `built_in.h` into your project.

- Lo
- Hi
- Higher
- Highest
- Delay_us
- Delay_ms
- Vdelay_ms
- Delay_Cyc
- Clock_Khz
- Clock_Mhz
- Get_Fosc_kHz

### Lo

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned short Lo(long number);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Returns the lowest 8 bits (byte) of <code>number</code>, bits 0..7.</td>
</tr>
<tr>
<td>Description</td>
<td>Function returns the lowest byte of <code>number</code>. Function does not interpret bit patterns of <code>number</code> – it merely returns 8 bits as found in register.</td>
</tr>
<tr>
<td></td>
<td>This is an “inline” routine; code is generated in the place of the call, so the call doesn’t count against the nested call limit.</td>

<tr>
<td>Description</td>
<td>Function returns device clock in KHz, rounded to the nearest integer. This is an “inline” routine; code is generated in the place of the call, so the call doesn’t count against the nested call limit.</td>
</tr>
<tr>
<td>Requires</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Example</td>
<td><code>clk = Clock_Khz();</code></td>
</tr>
</tbody>
</table>
Code Optimization

Optimizer has been added to extend the compiler usability, cut down the amount of code generated and speed-up its execution. The main features are:

Constant folding

All expressions that can be evaluated in the compile time (i.e. are constant) are being replaced by their results. \((3 + 5 \rightarrow 8)\);

Constant propagation

When a constant value is being assigned to a certain variable, the compiler recognizes this and replaces the use of the variable by constant in the code that follows, as long as the value of a variable remains unchanged.
Copy propagation

The compiler recognizes that two variables have the same value and eliminates one of them further in the code.

Value numbering

The compiler "recognizes" if two expressions yield the same result and can therefore eliminate the entire computation for one of them.

"Dead code" elimination

The code snippets that are not being used elsewhere in the programme do not affect the final result of the application. They are automatically removed.

Stack allocation

Temporary registers ("Stacks") are being used more rationally, allowing VERY complex expressions to be evaluated with a minimum stack consumption.

Local vars optimization

No local variables are being used if their result does not affect some of the global or volatile variables.

Better code generation and local optimization

Code generation is more consistent and more attention is payed to implement specific solutions for the code "building bricks" that further reduce output code size.

Related topics: PIC specifics, mikroC PRO for PIC specifics, Memory type specifiers
In order to get the most from your *mikroC PRO for PIC* compiler, you should be familiar with certain aspects of PIC MCU. This knowledge is not essential, but it can provide you a better understanding of PICs’ capabilities and limitations, and their impact on the code writing.
Types Efficiency

First of all, you should know that PIC’s ALU, which performs arithmetic operations, is optimized for working with bytes. Although mikroC PRO for PIC is capable of handling very complex data types, PIC may choke on them, especially if you are working on some of the older models. This can dramatically increase the time needed for performing even simple operations. Universal advice is to use the smallest possible type in every situation. It applies to all programming in general, and doubly so with microcontrollers.

Get to know your tool. When it comes down to calculus, not all PIC MCUs are of equal performance. For example, PIC16 family lacks hardware resources to multiply two bytes, so it is compensated by a software algorithm. On the other hand, PIC18 family has HW multiplier, and as a result, multiplication works considerably faster.

Nested Calls Limitations

Nested call represents a function call within function body, either to itself (recursive calls) or to another function. Recursive function calls are supported by mikroC PRO for PIC but with limitations. Recursive function calls can’t contain any function parameters and local variables due to the PIC’s stack and memory limitations.

mikroC PRO for PIC limits the number of non-recursive nested calls to:

- 8 calls for PIC12 family,
- 8 calls for PIC16 family,
- 31 calls for PIC18 family.

Note that some of the built-in routines do not count against this limit, due to their “inline” implementation.

Number of the allowed nested calls decreases by one if you use any of the following operators in the code: \* / \%. It further decreases if you use interrupts in the program. Number of decreases is specified by number of functions called from interrupt. Check functions reentrancy.

If the allowed number of nested calls is exceeded, the compiler will report a stack overflow error.
PIC18FxxJxx Specifics

Shared Address SFRs

*mikroC PRO for PIC* does not provide auto setting of bit for accessing alternate register. This is new feature added to pic18fxxjxx family and will be supported in future. In several locations in the SFR bank, a single address is used to access two different hardware registers. In these cases, a “legacy” register of the standard PIC18 SFR set (such as OSCCON, T1CON, etc.) shares its address with an alternate register. These alternate registers are associated with enhanced configuration options for peripherals, or with new device features not included in the standard PIC18 SFR map. A complete list of shared register addresses and the registers associated with them is provided in datasheet.

PIC16 Specifics

Breaking Through Pages

In applications targeted at PIC16, no single routine should exceed one page (2,000 instructions). If routine does not fit within one page, linker will report an error. When confront with this problem, maybe you should rethink the design of your application – try breaking the particular routine into several chunks, etc.

Limits of Indirect Approach Through FSR

Pointers with PIC16 are “near”: they carry only the lower 8 bits of the address. Compiler will automatically clear the 9th bit upon startup, so that pointers will refer to banks 0 and 1. To access the objects in banks 2 or 3 via pointer, user should manually set the IRP, and restore it to zero after the operation. The stated rules apply to any indirect approach: arrays, structures and unions assignments, etc.

**Note**: It is very important to take care of the IRP properly, if you plan to follow this approach. If you find this method to be inappropriate with too many variables, you might consider upgrading to PIC18.

**Note**: If you have many variables in the code, try rearranging them with the linker directive absolute. Variables that are approached only directly should be moved to banks 3 and 4 for increased efficiency.

Related topics: *mikroC PRO for PIC* specifics
MEMORY TYPE SPECIFIERS

The *mikroC PRO for PIC* supports usage of all memory areas. Each variable may be explicitly assigned to a specific memory space by including a memory type specifier in the declaration, or implicitly assigned.

The following memory type specifiers can be used:

- code
- data
- rx
- sfr

Memory type specifiers can be included in variable declaration. For example:

```c
char data           data_buffer;   // puts data_buffer in data ram
const char code txt[] = "ENTER PARAMETER:"; // puts text in program memory
```

**code**

<table>
<thead>
<tr>
<th>Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>The code memory type may be used for allocating constants in program memory.</td>
<td></td>
</tr>
<tr>
<td>Example</td>
<td>// puts txt in program memory</td>
</tr>
<tr>
<td></td>
<td>const char code txt[] = &quot;ENTER PARAMETER:&quot;;</td>
</tr>
</tbody>
</table>

**data**

<table>
<thead>
<tr>
<th>Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>This memory specifier is used when storing variable to the internal data SRAM.</td>
<td></td>
</tr>
<tr>
<td>Example</td>
<td>// puts PORTG in data ram</td>
</tr>
<tr>
<td></td>
<td>sfr data unsigned short PORTG absolute 0x65;</td>
</tr>
</tbody>
</table>

**rx**

<table>
<thead>
<tr>
<th>Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>This memory specifier allows variable to be stored in the Rx space (Register file).</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong>: In most of the cases, there will be enough space left for the user variables in the Rx space. However, since compiler uses Rx space for storing temporary variables, it might happen that user variables will be stored in the internal data SRAM, when writing complex programs.</td>
<td></td>
</tr>
<tr>
<td>Example</td>
<td>// puts y in Rx space</td>
</tr>
<tr>
<td></td>
<td>sfr char rx y;</td>
</tr>
</tbody>
</table>
Note: If none of the memory specifiers are used when declaring a variable, `data` specifier will be set as default by the compiler.

LEXICAL ELEMENTS OVERVIEW

The following topics provide a formal definition of the \textit{mikroC PRO for PIC} lexical elements. They describe different categories of word-like units (tokens) recognized by the \textit{mikroC PRO for PIC}.

In the tokenizing phase of compilation, the source code file is parsed (that is, broken down) into tokens and whitespace. The tokens in the \textit{mikroC PRO for PIC} are derived from a series of operations performed on your programs by the compiler and its built-in preprocessor.

WHITESPACE

Whitespace is a collective name given to spaces (blanks), horizontal and vertical tabs, newline characters and comments. Whitespace can serve to indicate where tokens start and end, but beyond this function, any surplus whitespace is discarded. For example, two sequences

\begin{verbatim}
int i; float f;
\end{verbatim}

and

\begin{verbatim}
int
 i;
 float f;
\end{verbatim}

are lexically equivalent and parse identically to give six tokens:

\begin{verbatim}
int
 i;
 float f;
\end{verbatim}
Whitespace in Strings

The ASCII characters representing whitespace can occur within string literals. In that case they are protected from the normal parsing process (they remain as a part of the string). For example,

```c
char name[] = "mikro foo";
```

parses into seven tokens, including a single string literal token:

```c
char
name
[
]
=
"mikro foo"  /* just one token here! */
;
```

Line Splicing with Backslash (\)

A special case occurs if a line ends with a backslash (\). Both backslash and new line character are discarded, allowing two physical lines of a text to be treated as one unit. So, the following code

```
mikroC PRO \
for PIC Compiler"
```

parses into "mikroC PRO for PIC Compiler". Refer to String Constants for more information.
COMMENTS

Comments are pieces of a text used to annotate a program and technically are another form of whitespace. Comments are for the programmer’s use only; they are stripped from the source text before parsing. There are two ways to delineate comments: the C method and the C++ method. Both are supported by mikroC PRO for PIC.

You should also follow the guidelines on the use of whitespace and delimiters in comments, discussed later in this topic to avoid other portability problems.

C comments

C comment is any sequence of characters placed after the symbol pair /*. The comment terminates at the first occurrence of the pair */ following the initial /*. The entire sequence, including four comment-delimiter symbols, is replaced by one space after macro expansion.

In the mikroC PRO for PIC,

```c
int /* type */ i /* identifier */;
```

parses as:

```c
int i;
```

Note that the mikroC PRO for PIC does not support a nonportable token pasting strategy using /**/. For more information on token pasting, refer to the Preprocessor Operators.

C++ comments

The mikroC PRO for PIC allows single-line comments using two adjacent slashes (/\*). The comment can start in any position and extends until the next new line.

The following code

```c
int i;  // this is a comment
int j;
```

parses as:

```c
int i;
int j;
```
Nested comments

ANSI C doesn’t allow nested comments. The attempt to nest a comment like this

```c
/* int */ declaration */ i; */
```

fails, because the scope of the first `/*` ends at the first `*/`. This gives us

```c
i; */
```

which would generate a syntax error.
TOKENS

Token is the smallest element of a C program that compiler can recognize. The parser separates tokens from the input stream by creating the longest token possible using the input characters in a left–to–right scan.

The *mikroC PRO for PIC* recognizes the following kinds of tokens:

- keywords
- identifiers
- constants
- operators
- punctuators (also known as separators)

Token Extraction Example

Here is an example of token extraction. Take a look at the following example code sequence:

```
inter = a+++b;
```

First, note that *inter* would be parsed as a single identifier, rather than as the keyword *int* followed by the identifier *er*.

The programmer who has written the code might have intended to write *inter = a + (++b)*, but it wouldn’t work that way. The compiler would parse it into the seven following tokens:

```
inter    // variable identifier
=        // assignment operator
a        // variable identifier
++       // postincrement operator
+        // addition operator
b        // variable identifier
;        // statement terminator
```

Note that +++ parses as ++ (the longest token possible) followed by +.

According to the operator precedence rules, our code sequence is actually:

```
inter (a++)+b;
```
CONSTANTS

Constants or *literals* are tokens representing fixed numeric or character values.

The *mikroC PRO for PIC* supports:

- integer constants
- floating point constants
- character constants
- string constants (strings literals)
- enumeration constants

The data type of a constant is deduced by the compiler using such clues as a numeric value and format used in the source code.

**Integer Constants**

Integer constants can be decimal (base 10), hexadecimal (base 16), binary (base 2), or octal (base 8). In the absence of any overriding suffixes, the data type of an integer constant is derived from its value.

**Long and Unsigned Suffixes**

The suffix \( L \) (or \( l \)) attached to any constant forces that constant to be represented as a long. Similarly, the suffix \( U \) (or \( u \)) forces a constant to be unsigned. Both \( L \) and \( U \) suffixes can be used with the same constant in any order or case: \( ul, Lu, UL \), etc.

In the absence of any suffix (\( U, u, L, \) or \( l \)), a constant is assigned the “smallest” of the following types that can accommodate its value: short, unsigned short, int, unsigned int, long int, unsigned long int.

Otherwise:

- If a constant has the \( U \) suffix, its data type will be the first of the following that can accommodate its value: unsigned short, unsigned int, unsigned long int.
- If a constant has the \( L \) suffix, its data type will be the first of the following that can accommodate its value: long int, unsigned long int.
- If a constant has both \( L \) and \( U \) suffixes, (\( LU \) or \( UL \)), its data type will be unsigned long int.
Decimals

Decimal constants from -2147483648 to 4294967295 are allowed. Constants exceeding these bounds will produce an “Out of range” error. Decimal constants must not use an initial zero. An integer constant that has an initial zero is interpreted as an octal constant. Thus,

```c
int i = 10;    /* decimal 10 */
int i = 010;   /* decimal 8 */
int i = 0;     /* decimal 0 = octal 0 */
```

In the absence of any overriding suffixes, the data type of a decimal constant is derived from its value, as shown below:

<table>
<thead>
<tr>
<th>Value Assigned to Constant</th>
<th>Assumed Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt; -2147483648</td>
<td>Error: Out of range!</td>
</tr>
<tr>
<td>-2147483648 – -32769</td>
<td>long</td>
</tr>
<tr>
<td>-32768 – -129</td>
<td>int</td>
</tr>
<tr>
<td>-128 – 127</td>
<td>short</td>
</tr>
<tr>
<td>128 – 255</td>
<td>unsigned short</td>
</tr>
<tr>
<td>256 – 32767</td>
<td>int</td>
</tr>
<tr>
<td>32768 – 65535</td>
<td>unsigned int</td>
</tr>
<tr>
<td>65536 – 2147483647</td>
<td>long</td>
</tr>
<tr>
<td>2147483648 – 4294967295</td>
<td>unsigned long</td>
</tr>
<tr>
<td>&gt; 4294967295</td>
<td>Error: Out of range!</td>
</tr>
</tbody>
</table>

Hexadecimal Constants

All constants starting with 0x (or 0X) are taken to be hexadecimal. In the absence of any overriding suffixes, the data type of an hexadecimal constant is derived from its value, according to the rules presented above. For example, 0x3C67 will be treated as unsigned int.
Binary Constants

All constants starting with \texttt{0b} (or \texttt{0B}) are taken to be binary. In the absence of any overriding suffixes, the data type of an binary constant is derived from its value, according to the rules presented above. For example, \texttt{0b11101} will be treated as \texttt{short}.

Octal Constants

All constants with an initial zero are taken to be octal. If an octal constant contains the illegal digits 8 or 9, an error is reported. In the absence of any overriding suffixes, the data type of an octal constant is derived from its value, according to the rules presented above. For example, \texttt{0777} will be treated as \texttt{int}.

Floating Point Constants

A floating-point constant consists of:

- Decimal integer
- Decimal point
- Decimal fraction
- \texttt{e} or \texttt{E} and a signed integer exponent (optional)
- Type suffix: \texttt{f} or \texttt{F} or \texttt{l} or \texttt{L} (optional)

Either decimal integer or decimal fraction (but not both) can be omitted. Either decimal point or letter \texttt{e} (or \texttt{E}) with a signed integer exponent (but not both) can be omitted. These rules allow conventional and scientific (exponent) notations.

Negative floating constants are taken as positive constants with an unary operator minus (-) prefixed.

The \textit{mikroC PRO for PIC} limits floating-point constants to the range $\pm1.17549435082 \times 10^{-38}$ .. $\pm6.80564774407 \times 10^{38}$.

Here are some examples:

\begin{verbatim}
0.       // = 0.0
-1.23    // = -1.23
23.45e6  // = 23.45 * 10^6
2e-5     // = 2.0 * 10^-5
3E+10    // = 3.0 * 10^10
.09E34   // = 0.09 * 10^34
\end{verbatim}

The \textit{mikroC PRO for PIC} floating-point constants are of the type \texttt{double}. Note that the \textit{mikroC PRO for PIC}'s implementation of ANSI Standard considers \texttt{float} and \texttt{double} (together with the \texttt{long double} variant) to be the same type.
Character Constants

A character constant is one or more characters enclosed in single quotes, such as 'A', '+', or '\n'. In the mikroC PRO for PIC, single-character constants are of the `unsigned int` type. Multi-character constants are referred to as string constants or string literals. For more information refer to String Constants.

Escape Sequences

A backslash character (\) is used to introduce an escape sequence, which allows a visual representation of certain nongraphic characters. One of the most common escape constants is the newline character (\n).

A backslash is used with octal or hexadecimal numbers to represent an ASCII symbol or control code corresponding to that value; for example, '\x3F' for the question mark. Any value within legal range for data type char (0 to 0xFF for the mikroC PRO for PIC) can be used. Larger numbers will generate the compiler error “Out of range”. For example, the octal number \777 is larger than the maximum value allowed (\377) and will generate an error. The first nonoctal or nonhexadecimal character encountered in an octal or hexadecimal escape sequence marks the end of the sequence.

**Note**: You must use the sequence `\` to represent an ASCII backslash, as used in operating system paths.

The following table shows the available escape sequences:

<table>
<thead>
<tr>
<th>Sequence</th>
<th>Value</th>
<th>Char</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\a</td>
<td>0x07</td>
<td>BEL</td>
<td>Audible bell</td>
</tr>
<tr>
<td>\b</td>
<td>0x08</td>
<td>BS</td>
<td>Backspace</td>
</tr>
<tr>
<td>\f</td>
<td>0x0C</td>
<td>FF</td>
<td>Formfeed</td>
</tr>
<tr>
<td>\n</td>
<td>0x0A</td>
<td>LF</td>
<td>Newline (Linefeed)</td>
</tr>
<tr>
<td>\r</td>
<td>0x0D</td>
<td>CR</td>
<td>Carriage Return</td>
</tr>
<tr>
<td>\t</td>
<td>0x09</td>
<td>HT</td>
<td>Tab (horizontal)</td>
</tr>
<tr>
<td>\v</td>
<td>0x0B</td>
<td>VT</td>
<td>Vertical Tab</td>
</tr>
<tr>
<td><code>\</code></td>
<td>0x5C</td>
<td>\</td>
<td>Backslash</td>
</tr>
<tr>
<td><code>'</code></td>
<td>0x27</td>
<td>'</td>
<td>Single quote (Apostrophe)</td>
</tr>
<tr>
<td><code>&quot;</code></td>
<td>0x22</td>
<td>&quot;</td>
<td>Double quote</td>
</tr>
<tr>
<td><code>?</code></td>
<td>0x3F</td>
<td>?</td>
<td>Question mark</td>
</tr>
<tr>
<td><code>\O</code></td>
<td>any</td>
<td>O = string of up to 3 octal digits</td>
<td></td>
</tr>
<tr>
<td><code>\xH</code></td>
<td>any</td>
<td>H = string of hex digits</td>
<td></td>
</tr>
<tr>
<td><code>\XH</code></td>
<td>any</td>
<td>H = string of hex digits</td>
<td></td>
</tr>
</tbody>
</table>
Disambiguation

Some ambiguous situations might arise when using escape sequences.

Here is an example:

```
Lcd_Out_Cp("\x091.0 Intro");
```

This is intended to be interpreted as `\x09` and "1.0 Intro". However, the mikroC PRO for PIC compiles it as the hexadecimal number `\x091` and literal string "1.0 Intro". To avoid such problems, we could rewrite the code in the following way:

```
Lcd_Out_Cp("\x09" "1.0 Intro");
```

For more information on the previous line, refer to String Constants.

Ambiguities might also arise if an octal escape sequence is followed by a nonoctal digit. For example, the following constant:

```
"\118"
```

would be interpreted as a two-character constant made up of the characters `\11` and 8, because 8 is not a legal octal digit.

String Constants

String constants, also known as string literals, are a special type of constants which store fixed sequences of characters. A string literal is a sequence of any number of characters surrounded by double quotes:

```
"This is a string."
```

The null string, or empty string, is written like "". A literal string is stored internally as a given sequence of characters plus a final null character. A null string is stored as a single null character.

The characters inside the double quotes can include escape sequences. This code, for example:

```
"\t"Name\\tAddress\n\n"
```

prints like this:

```
"Name" Address
```
The "Name" is preceded by two tabs; The Address is preceded by one tab. The line is followed by two new lines. The \" provides interior double quotes. The escape character sequence `\\` is translated into `\` by the compiler.

Adjacent string literals separated only by whitespace are concatenated during the parsing phase. For example:

"This is " "just"
    " an example."

is equivalent to

"This is just an example."

**Line Continuation with Backslash**

You can also use the backslash (`\`) as a continuation character to extend a string constant across line boundaries:

"This is really \
    a one-line string."

**Enumeration Constants**

Enumeration constants are identifiers defined in `enum` type declarations. The identifiers are usually chosen as mnemonics to contribute to legibility. Enumeration constants are of `int` type. They can be used in any expression where integer constants are valid.

For example:

```c
enum weekdays { SUN = 0, MON, TUE, WED, THU, FRI, SAT };
```

The identifiers (enumerators) used must be unique within the scope of the `enum` declaration. Negative initializers are allowed. See Enumerations for details about `enum` declarations.
Pointer Constants

A pointer or pointed-at object can be declared with the const modifier. Anything declared as const cannot change its value. It is also illegal to create a pointer that might violate a non-assignability of the constant object.

Consider the following examples:

```c
int i; // i is an int
int * pi; // pi is a pointer to int (uninitialized)
int * const cp = &i; // cp is a constant pointer to int
const int ci = 7; // ci is a constant int
const int * pci; // pci is a pointer to constant int
const int * const cpc = &ci; // cpc is a constant pointer to a
                           // constant int
```

The following assignments are legal:

```c
i = ci; // Assign const-int to int
*cp = ci; // Assign const-int to
         // object-pointed-at-by-a-const-pointer
++pci; // Increment a pointer-to-const
pci = cpc; // Assign a const-pointer-to-a-const to a
           // pointer-to-const
```

The following assignments are illegal:

```c
ci = 0; // NO--cannot assign to a const-int
ci--; // NO--cannot change a const-int
*pci = 3; // NO--cannot assign to an object
          // pointed at by pointer-to-const.
cp = &ci; // NO--cannot assign to a const-pointer,
          // even if value would be unchanged.
cpc++; // NO--cannot change const-pointer
pi = pci; // NO--if this assignment were allowed,
          // you would be able to assign to *pci
          // (a const value) by assigning to *pi.
```

Similar rules are applied to the volatile modifier. Note that both const and volatile can appear as modifiers to the same identifier.
Constant Expressions

A constant expression can be evaluated during translation rather than runtime and accordingly may be used in any place that a constant may be.

Constant expressions can consist only of the following:

- literals,
- enumeration constants,
- simple constants (no constant arrays or structures),
- `sizeof` operators.

Constant expressions cannot contain any of the following operators, unless the operators are contained within the operand of a `sizeof` operator: assignment, comma, decrement, function call, increment.

Each constant expression can evaluate to a constant that is in the range of representable values for its type.

Constant expression can be used anywhere a constant is legal.
KEYWORDS

Keywords are words reserved for special purposes and must not be used as normal identifier names. Beside standard C keywords, all relevant SFR are defined as global variables and represent reserved words that cannot be redefined (for example: TMR0, PCL, etc). Probe the Code Assistant for specific letters (Ctrl+Space in Editor) or refer to Pre-defined Globals and Constants.

Here is an alphabetical listing of keywords in C:

- asm
- auto
- break
- case
- char
- const
- continue
- default
- do
- double
- else
- enum
- extern
- float
- for
- goto
- if
- int
- long
- register
- return
- short
- signed
- sizeof
- static
- struct
- switch
- typedef
- union
- unsigned
- void
- volatile
- while

Also, the mikroC PRO for PIC includes a number of predefined identifiers used in libraries. You could replace them by your own definitions, if you want to develop your own libraries. For more information, see mikroC PRO for PIC Libraries.
IDENTIFIERS

Identifiers are arbitrary names of any length given to functions, variables, symbolic constants, user-defined data types, and labels. All these program elements will be referred to as objects throughout the help (don't get confused with the meaning of object in object-oriented programming).

Identifiers can contain the letters a to z and A to Z, underscore character "_", and digits 0 to 9. The only restriction is that the first character must be a letter or an underscore.

Case Sensitivity

The mikroC PRO for PIC identifiers aren't case sensitive by default, so that Sum, sum, and suM represent an equivalent identifier. Case sensitivity can be activated or suspended in Output Settings window. Even if case sensitivity is turned off Keywords remain case sensitive and they must be written in lower case.

Uniqueness and Scope

Although identifier names are arbitrary (according to the stated rules), if the same name is used for more than one identifier within the same scope and sharing the same name space then error arises. Duplicate names are legal for different name spaces regardless of scope rules. For more information on scope, refer to Scope and Visibility.

Identifier Examples

Here are some valid identifiers:

```
temperature_V1
Pressure
no_hit
dat2string
SUM3
_vtext
```

... and here are some invalid identifiers:

```
7temp     // NO -- cannot begin with a numeral
%higher   // NO -- cannot contain special characters
int      // NO -- cannot match reserved word
j23.07.04 // NO -- cannot contain special characters (dot)
```
PUNCTUATORS

The *mikroC PRO for PIC* punctuators (also known as separators) are:

- [] – Brackets
- () – Parentheses
- {} – Braces
- , – Comma
- ; – Semicolon
- : – Colon
- * – Asterisk
- = – Equal sign
- # – Pound sign

Most of these punctuators also function as operators.

**Brackets**

Brackets [ ] indicate single and multidimensional array subscripts:

```c
char ch, str[] = "mikro";

int mat[3][4]; /* 3 x 4 matrix */
ch = str[3]; /* 4th element */
```

**Parentheses**

Parentheses ( ) are used to group expressions, isolate conditional expressions, and indicate function calls and function parameters:

```c
d = c * (a + b); /* override normal precedence */

if (d == z) ++x; /* essential with conditional statement */
func(); /* function call, no args */
void func2(int n); /* function declaration with parameters */
```

Parentheses are recommended in macro definitions to avoid potential precedence problems during an expansion:

```c
#define CUBE(x) ((x) * (x) * (x))
```

For more information, refer to Operators Precedence And Associativity and Expressions.
**Braces**

Braces `{ }` indicate the start and end of a compound statement:

```c
if (d == z) {
    ++x;
    func();
}
```

Closing brace serves as a terminator for the compound statement, so a semicolon is not required after `}`, except in structure declarations. Sometimes, the semicolon can be illegal, as in

```c
if (statement)
    { ... };    /* illegal semicolon! */
else
    { ... };
```

For more information, refer to the Compound Statements.

**Comma**

Comma `,` separates the elements of a function argument list:

```c
void func(int n, float f, char ch);
```

Comma is also used as an operator in comma expressions. Mixing two uses of comma is legal, but you must use parentheses to distinguish them. Note that `(exp1, exp2)` evaluates both but is equal to the second:

```c
func(i, j);                         /* call func with two args */
func((exp1, exp2), (exp3, exp4, exp5)); /* also calls func with two args! */
```

**Semicolon**

Semicolon `;` is a statement terminator. Any legal C expression (including the empty expression) followed by a semicolon is interpreted as a statement, known as an expression statement. The expression is evaluated and its value is discarded. If the expression statement has no side effects, the *mikroC PRO for PIC* might ignore it.

```c
a + b;       /* Evaluate a + b, but discard value */
++a;         /* Side effect on a, but discard value of ++a */
;            /* Empty expression, or a null statement */
```
Semicolons are sometimes used to create an empty statement:

```c
for (i = 0; i < n; i++);
```

For more information, see the Statements.

**Colon**

Use colon (:) to indicate the labeled statement:

```c
start:  x = 0;
...    
goto start;
```

Labels are discussed in the Labeled Statements.

**Asterisk (Pointer Declaration)**

Asterisk (*) in a variable declaration denotes the creation of a pointer to a type:

```c
char *char_ptr;  /* a pointer to char is declared */
```

Pointers with multiple levels of indirection can be declared by indicating a pertinent number of asterisks:

```c
int **int_ptr;  /* a pointer to an array of integers */
double ***double_ptr;  /* a pointer to a matrix of doubles */
```

You can also use asterisk as an operator to either dereference a pointer or as multiplication operator:

```c
i = *int_ptr;
a = b * 3.14;
```

For more information, see the Pointers.
Equal sign (=) separates variable declarations from initialization lists:

```c
int test[5] = { 1, 2, 3, 4, 5 };  
int x = 5;
```

Equal sign is also used as an assignment operator in expressions:

```c
int a, b, c;  
a = b + c;
```

For more information, see Assignment Operators.

**Pound Sign (Preprocessor Directive)**

Pound sign (#) indicates a preprocessor directive when it occurs as the first non-whitespace character on a line. It signifies a compiler action, not necessarily associated with a code generation. See the Preprocessor Directives for more information.

`#` and `##` are also used as operators to perform token replacement and merging during the preprocessor scanning phase. See the Preprocessor Operators.
CONCEPTS

This section covers some basic concepts of language, essential for understanding of how C programs work. First, we need to establish the following terms that will be used throughout the help:

- Objects and Ivalues
- Scope and Visibility
- Name Spaces
- Duration

Objects

An object is a specific region of memory that can hold a fixed or variable value (or set of values). This use of a term *object* is different from the same term, used in object-oriented languages, which is more general. Our definition of the word would encompass functions, variables, symbolic constants, user-defined data types, and labels.

Each value has an associated name and type (also known as a data type). The name is used to access the object and can be a simple identifier or complex expression that uniquely refers the object.

Objects and Declarations

Declarations establish a necessary mapping between identifiers and objects. Each declaration associates an identifier with a data type.

Associating identifiers with objects requires each identifier to have at least two attributes: storage class and type (sometimes referred to as data type). The *mikroC PRO for PIC* compiler deduces these attributes from implicit or explicit declarations in the source code. Usually, only the type is explicitly specified and the storage class specifier assumes the automatic value `auto`.

Generally speaking, an identifier cannot be legally used in a program before its declaration point in the source code. Legal exceptions to this rule (known as forward references) are labels, calls to undeclared functions, and struct or union tags. The range of objects that can be declared includes:

- Variables
- Functions
- Types
- Arrays of other types
- Structure, union, and enumeration tags
- Structure members
- Union members
- Enumeration constants
- Statement labels
- Preprocessor macros

The recursive nature of the declarator syntax allows complex declarators. You’ll probably want to use typedefs to improve legibility if constructing complex objects.

**Lvalues**

*Lvalue* is an object locator: an expression that designates an object. An example of lvalue expression is \(^*P\), where \(P\) is any expression evaluating to a non-null pointer. A modifiable lvalue is an identifier or expression that relates to an object that can be accessed and legally changed in memory. A const pointer to a constant, for example, is not a modifiable lvalue. A pointer to a constant can be changed (but its dereferenced value cannot).

Historically, l stood for “left”, meaning that lvalue could legally stand on the left (the receiving end) of an assignment statement. Now only modifiable lvalues can legally stand to the left of an assignment operator. For example, if \(a\) and \(b\) are non-constant integer identifiers with properly allocated memory storage, they are both modifiable lvalues, and assignments such as \(a = 1\) and \(b = a + b\) are legal.

**Rvalues**

The expression \(a + b\) is not lvalue: \(a + b = a\) is illegal because the expression on the left is not related to an object. Such expressions are sometimes called *rvalues* (short for right values).
Scope and Visibility

Scope

The scope of an identifier is a part of the program in which the identifier can be used to access its object. There are different categories of scope: block (or local), function, function prototype, and file. These categories depend on how and where identifiers are declared.

- **Block**: The scope of an identifier with block (or local) scope starts at the declaration point and ends at the end of the block containing the declaration (such block is known as the enclosing block). Parameter declarations with a function definition also have block scope, limited to the scope of the function body.

- **File**: File scope identifiers, also known as *globals*, are declared outside of all blocks; their scope is from the point of declaration to the end of the source file.

- **Function**: The only identifiers having function scope are statement labels. Label names can be used with goto statements anywhere in the function in which the label is declared. Labels are declared implicitly by writing `label_name: follow`ed by a statement. Label names must be unique within a function.

- **Function prototype**: Identifiers declared within the list of parameter declarations in a function prototype (not as a part of a function definition) have a function prototype scope. This scope ends at the end of the function prototype.

Visibility

The visibility of an identifier is a region of the program source code from which an identifier’s associated object can be legally accessed.

Scope and visibility usually coincide, though there are circumstances under which an object becomes temporarily hidden by the appearance of a duplicate identifier: the object still exists but the original identifier cannot be used to access it until the scope of the duplicate identifier ends.

Technically, visibility cannot exceed a scope, but a scope can exceed visibility. See the following example:

```c
void f (int i) {
    int j; // auto by default
    j = 3; // int i and j are in scope and visible

    { // nested block
        double j; // j is local name in the nested block
        j = 0.1; // i and double j are visible;
                  // int j = 3 in scope but hidden
    }
}
```
Name Spaces

Name space is a scope within which an identifier must be unique. The *mikroC PRO for PIC* uses four distinct categories of identifiers:

1. goto label names - must be unique within the function in which they are declared.
2. Structure, union, and enumeration tags - must be unique within the block in which they are defined. Tags declared outside of any function must be unique.
3. Structure and union member names - must be unique within the structure or union in which they are defined. There is no restriction on the type or offset of members with the same member name in different structures.
4. Variables, typedefs, functions, and enumeration members - must be unique within the scope in which they are defined. Externally declared identifiers must be unique among externally declared variables.

Duplicate names are legal for different name spaces regardless of the scope rules.

For example:

```c
int blue = 73;
{
    enum colors { black, red, green, blue, violet, white } c;
    /* enumerator blue = 3 now hides outer declaration of int blue */
    struct colors { int i, j; }; // ILLEGAL: colors duplicate tag
    double red = 2; // ILLEGAL: redefinition of red
}
blue = 37; // back in int blue scope
```

Duration

Duration, closely related to a storage class, defines a period during which the declared identifiers have real, physical objects allocated in memory. We also distinguish between compile-time and run-time objects. Variables, for instance, unlike typedefs and types, have real memory allocated during run time. There are two kinds of duration: *static* and *local*. 
Static Duration

Memory is allocated to objects with static duration as soon as execution is underway; this storage allocation lasts until the program terminates. Static duration objects usually reside in fixed data segments allocated according to the memory specifier in force. All globals have static duration. All functions, wherever defined, are objects with static duration. Other variables can be given static duration by using the explicit `static` or `extern` storage class specifiers.

In the *mikroC PRO for PIC*, static duration objects are *not* initialized to zero (or null) in the absence of any explicit initializer.

Don’t mix static duration with file or global scope. An object can have static duration *and* local scope – see the example below.

Local Duration

Local duration objects are also known as *automatic* objects. They are created on the stack (or in a register) when an enclosing block or a function is entered. They are deallocated when the program exits that block or function. Local duration objects must be explicitly initialized; otherwise, their contents are unpredictable. The storage class specifier `auto` can be used when declaring local duration variables, but it is usually redundant, because `auto` is default for variables declared within a block.

An object with local duration also has local scope because it does not exist outside of its enclosing block. On the other hand, a local scope object *can* have static duration. For example:

```c
void f() {
    /* local duration variable; init a upon every call to f */
    int a = 1;
    /* static duration variable; init b only upon first call to f */
    static int b = 1;
    /* checkpoint! */
    a++;
    b++;
}

void main() {
    /* At checkpoint, we will have: */
    f(); // a=1, b=1, after first call,
    f(); // a=1, b=2, after second call,
    f(); // a=1, b=3, after third call,
    // etc.
}
```
TYPES

The *mikroC PRO for PIC* is a strictly typed language, which means that every object, function, and expression must have a strictly defined type, known in the time of compilation. Note that the *mikroC PRO for PIC* works exclusively with numeric types.

The type serves:

- to determine the correct memory allocation required initially.
- to interpret the bit patterns found in the object during subsequent access.
- in many type-checking situations, to ensure that illegal assignments are trapped.

The *mikroC PRO for PIC* supports many standard (predefined) and user-defined data types, including signed and unsigned integers in various sizes, floating-point numbers with various precisions, arrays, structures, and unions. In addition, pointers to most of these objects can be established and manipulated in memory.

The type determines how much memory is allocated to an object and how the program will interpret the bit patterns found in the object's storage allocation. A given data type can be viewed as a set of values (often implementation-dependent) that identifiers of that type can assume, together with a set of operations allowed with these values. The compile-time operator `sizeof` allows you to determine the size in bytes of any standard or user-defined type.

The *mikroC PRO for PIC* standard libraries and your own program and header files must provide unambiguous identifiers (or expressions derived from them) and types so that the *mikroC PRO for PIC* can consistently access, interpret, and (possibly) change the bit patterns in memory corresponding to each active object in your program.

**Type Categories**

A common way to categorize types is to divide them into:

- fundamental
- derived

The fundamental types represent types that cannot be split up into smaller parts. They are sometimes referred to as *unstructured* types. The fundamental types are `void`, `char`, `int`, `float`, and `double`, together with `short`, `long`, `signed`, and `unsigned` variants of some of them. For more information on fundamental types, refer to the topic Fundamental Types.

The derived types are also known as *structured* types and they include pointers to other types, arrays of other types, function types, structures, and unions. For more information on derived types, refer to the topic Derived Types.
**Fundamental Types**

The fundamental types represent types that cannot be divided into more basic elements, and are the model for representing elementary data on machine level. The fundamental types are sometimes referred to as *unstructured types*, and are used as elements in creating more complex derived or user-defined types.

The fundamental types include:

- Arithmetic Types
- Enumerations
- Void Type

**Arithmetic Types**

The arithmetic type specifiers are built up from the following keywords: `void`, `char`, `int`, `float` and `double`, together with the prefixes `short`, `long`, `signed` and `unsigned`. From these keywords you can build both integral and floating-point types.

**Integral Types**

The types `char` and `int`, together with their variants, are considered to be integral data types. Variants are created by using one of the prefix modifiers `short`, `long`, `signed` and `unsigned`.

In the table below is an overview of the integral types – keywords in parentheses can be (and often are) omitted.

The modifiers `signed` and `unsigned` can be applied to both `char` and `int`. In the absence of the unsigned prefix, signed is automatically assumed for integral types. The only exception is `char`, which is `unsigned` by default. The keywords `signed` and `unsigned`, when used on their own, mean `signed int` and `unsigned int`, respectively.

The modifiers `short` and `long` can only be applied to `int`. The keywords `short` and `long`, used on their own, mean `short int` and `long int`, respectively.
Floating-point Types

The types `float` and `double`, together with the `long double` variant, are considered to be floating-point types. The `mikroC PRO for PIC`'s implementation of an ANSI Standard considers all three to be the same type.

Floating point in the `mikroC PRO for PIC` is implemented using the Microchip AN575 32-bit format (IEEE 754 compliant).

An overview of the floating-point types is shown in the table below:

<table>
<thead>
<tr>
<th>Type</th>
<th>Size in Bytes</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>float</code></td>
<td>4</td>
<td>-1.5 * 10^45 .. +3.4 * 10^38</td>
</tr>
<tr>
<td><code>double</code></td>
<td>4</td>
<td>-1.5 * 10^45 .. +3.4 * 10^38</td>
</tr>
<tr>
<td><code>long double</code></td>
<td>4</td>
<td>-1.5 * 10^45 .. +3.4 * 10^38</td>
</tr>
</tbody>
</table>
Enumerations

An enumeration data type is used for representing an abstract, discreet set of values with appropriate symbolic names.

Enumeration Declaration

Nullification is declared like this:

```c
enum tag {enumeration-list};
```

Here, `tag` is an optional name of the enumeration; `enumeration-list` is a comma-delimited list of discreet values, enumerators (or enumeration constants). Each enumerator is assigned a fixed integral value. In the absence of explicit initializers, the first enumerator is set to zero, and the value of each succeeding enumerator is set to a value of its predecessor increased by one.

Variables of the `enum` type are declared the same as variables of any other type. For example, the following declaration:

```c
enum colors { black, red, green, blue, violet, white } c;
```

establishes a unique integral type, `enum colors`, variable `c` of this type, and set of enumerators with constant integer values (black = 0, red = 1, ...). In the mikroC PRO for PIC, a variable of an enumerated type can be assigned any value of the type `int` – no type checking beyond that is enforced. That is:

```c
c = red;       // OK
```

```c
c = 1;         // Also OK, means the same
```

With explicit integral initializers, you can set one or more enumerators to specific values. The initializer can be any expression yielding a positive or negative integer value (after possible integer promotions). Any subsequent names without initializers will be increased by one. These values are usually unique, but duplicates are legal.

The order of constants can be explicitly re-arranged. For example:

```c
enum colors { black,       // value 0
             red,          // value 1
             green,       // value 2
             blue=6,      // value 6
             violet,      // value 7
             white=4 };   // value 4
```
Initializer expression can include previously declared enumerators. For example, in the following declaration:

```c
enum memory_sizes { bit = 1, nibble = 4 * bit, byte = 2 * nibble, kilobyte = 1024 * byte };
```

nibble would acquire the value 4, byte the value 8, and kilobyte the value 8192.

**Anomous Enum Type**

In our previous declaration, the identifier `colors` is an optional enumeration tag that can be used in subsequent declarations of enumeration variables of the `enum colors` type:

```c
double red = 2;               // ILLEGAL: redefinition of red
```

```c
enum colors bg, border;  /* declare variables bg and border */
```

Like with struct and union declarations, you can omit the tag if no further variables of this `enum` type are required:

```c
/* Anonymous enum type: */
enum { black, red, green, blue, violet, white } color;
```

**Enumeration Scope**

Enumeration tags share the same name space as structure and union tags. Enumerators share the same name space as ordinary variable identifiers:

```c
int blue = 73;
```

```c
{ // open a block
    struct colors { int i, j; };
    // ILLEGAL: colors duplicate tag
    struct colors { int i, j; };
    // ILLEGAL: redefinition of colors
}
```

```c
blue = 37;  // back in int blue scope
```
Void Type

*void* is a special type indicating the absence of any value. There are no objects of *void*; instead, *void* is used for deriving more complex types.

Void Functions

Use the *void* keyword as a function return type if the function does not return a value.

```c
void print_temp(char temp) {
    Lcd_Out_Cp("Temperature: ");
    Lcd_Out_Cp(temp);
    Lcd_Chr_Cp(223);  // degree character
    Lcd_Chr_Cp('C');
}
```

Use *void* as a function heading if the function does not take any parameters. Alternatively, you can just write empty parentheses:

```c
main(void) { // same as main()
    ... 
}
```

Generic Pointers

Pointers can be declared as *void*, which means that they can point to any type. These pointers are sometimes called *generic*. 
Derived Types

The derived types are also known as structured types. They are used as elements in creating more complex user-defined types.

The derived types include:

- arrays
- pointers
- structures
- unions

Arrays

Array is the simplest and most commonly used structured type. A variable of array type is actually an array of objects of the same type. These objects represent elements of an array and are identified by their position in array. An array consists of a contiguous region of storage exactly large enough to hold all of its elements.

Array Declaration

Array declaration is similar to variable declaration, with the brackets added after identifier:

```c
type array_name[constant-expression]
```

This declares an array named as `array_name` and composed of elements of `type`. The `type` can be any scalar type (except `void`), user-defined type, pointer, enumeration, or another array. Result of `constant-expression` within the brackets determines a number of elements in array. If an expression is given in an array declarator, it must evaluate to a positive constant integer. The value is a number of elements in an array.

Each of the elements of an array is indexed from 0 to the number of elements minus one. If a number of elements is `n`, elements of array can be approached as variables `array_name[0] .. array_name[n-1]` of `type`.

Here are a few examples of array declaration:

```c
#define MAX = 50
int vector_one[10]; /* declares an array of 10 integers */
float vector_two[ MAX]; /* declares an array of 50 floats */
float vector_three[ MAX - 20]; /* declares an array of 30 floats */
```
**Array Initialization**

An array can be initialized in declaration by assigning it a comma-delimited sequence of values within braces. When initializing an array in declaration, you can omit the number of elements – it will be automatically determined according to the number of elements assigned. For example:

```c
/* Declare an array which holds number of days in each month: */

/* This declaration is identical to the previous one */
int days[] = {31,28,31,30,31,30,31,31,30,31,30,31};
```

If you specify both the length and starting values, the number of starting values must not exceed the specified length. The opposite is possible, in this case the trailing “excess” elements will be assigned to some encountered runtime values from memory.

In case of array of `char`, you can use a shorter *string literal* notation. For example:

```c
/* The two declarations are identical: */
const char msg1[] = {'T', 'e', 's', 't', '\0'};
const char msg2[] = "Test";
```

For more information on string literals, refer to String Constants.

**Arrays n Expressions**

When the name of an array comes up in expression evaluation (except with operators `&` and `sizeof`), it is implicitly converted to the pointer pointing to array’s first element. See Arrays and Pointers for more information.

**Multi-dimensional Arrays**

An array is one-dimensional if it is of scalar type. One-dimensional arrays are sometimes referred to as *vectors*.

Multidimensional arrays are constructed by declaring arrays of array type. These arrays are stored in memory in such way that the right most subscript changes fastest, i.e. arrays are stored “in rows”. Here is a sample of 2-dimensional array:

```c
float m[50][20];  /* 2-dimensional array of size 50x20 */
```

A variable `m` is an array of 50 elements, which in turn are arrays of 20 floats each. Thus, we have a matrix of 50x20 elements: the first element is `m[0][0]`, the last one...
is $m[49][19]$ . The first element of the 5th row would be $m[4][0]$.

If you don't initialize the array in the declaration, you can omit the first dimension of multi-dimensional array. In that case, array is located elsewhere, e.g. in another file. This is a commonly used technique when passing arrays as function parameters:

```c
int a[3][2][4]; /* 3-dimensional array of size 3x2x4 */
void func(int n[][2][4]) { /* we can omit first dimension */
    ...
    n[2][1][3]++; /* increment the last element*/
}

void main() {
    ...
    func(a);
}
```

You can initialize a multi-dimensional array with an appropriate set of values within braces. For example:

```c
int a[3][2] = {{1,2}, {2,6}, {3,7}};
```

**Pointers**

Pointers are special objects for holding (or “pointing to”) memory addresses. In the `mikroC PRO for PIC`, address of an object in memory can be obtained by means of an unary operator &. To reach the pointed object, we use an indirection operator ( * ) on a pointer.

A pointer of type “pointer to object of type” holds the address of (that is, points to) an object of type. Since pointers are objects, you can have a pointer pointing to a pointer (and so on). Other objects commonly pointed to include arrays, structures, and unions.

A pointer to a function is best thought of as an address, usually in a code segment, where that function’s executable code is stored; that is, the address to which control is transferred when that function is called.

Although pointers contain numbers with most of the characteristics of unsigned integers, they have their own rules and restrictions for declarations, assignments, conversions, and arithmetic. The examples in the next few sections illustrate these rules and restrictions.
**Pointer Declarations**

Pointers are declared the same as any other variable, but with * ahead of identifier. A type at the beginning of declaration specifies the type of a pointed object. A pointer must be declared as pointing to some particular type, even if that type is `void`, which really means a pointer to anything. Pointers to `void` are often called *generic pointers*, and are treated as pointers to `char` in the *mikroC PRO for PIC*.

If `type` is any predefined or user-defined type, including `void`, the declaration

```c
type *p;   /* Uninitialized pointer */
```

declares `p` to be of type “pointer to `type`”. All scoping, duration, and visibility rules are applied to the `p` object just declared. You can view the declaration in this way: if `*p` is an object of `type`, then `p` has to be a pointer to such object (object of `type`).

Note: You must initialize pointers before using them! Our previously declared pointer `*p` is not initialized (i.e. assigned a value), so it cannot be used yet.

Note: In case of multiple pointer declarations, each identifier requires an indirect operator. For example:

```c
int *pa, *pb, *pc;
/* is same as: */

int *pa;
int *pb;
int *pc;
```

Once declared, though, a pointer can usually be reassigned so that it points to an object of another type. The *mikroC PRO for PIC* lets you reassign pointers without typecasting, but the compiler will warn you unless the pointer was originally declared to be pointing to `void`. You can assign the `void*` pointer to the `non-void*` pointer – refer to `void` for details.
Null Pointers

A null pointer value is an address that is guaranteed to be different from any valid pointer in use in a program. Assigning the integer constant 0 to a pointer assigns a null pointer value to it.

For example:

```c
int *pn = 0; /* Here's one null pointer */

/* We can test the pointer like this: */
if ( pn == 0 ) { ... }
```

The pointer type “pointer to void” must not be confused with the null pointer. The declaration

```c
void *vp;
```

declares that vp is a generic pointer capable of being assigned to by any “pointer to type” value, including null, without complaint.

Assignments without proper casting between a “pointer to type1” and a “pointer to type2”, where type1 and type2 are different types, can invoke a compiler warning or error. If type1 is a function and type2 isn't (or vice versa), pointer assignments are illegal. If type1 is a pointer to void, no cast is needed. If type2 is a pointer to void, no cast is needed.

Function Pointers

Function Pointers are pointers, i.e. variables, which point to the address of a function.

```c
// Define a function pointer
int (*pt2Function) (float, char, char);
```

Note: Thus functions and function pointers with different calling convention (argument order, arguments type or return type is different) are incompatible with each other.
Assign an address to a Function Pointer

It's quite easy to assign the address of a function to a function pointer. Simply take the name of a suitable and known function. Using the address operator \& in front of the function's name is optional.

```c
//Assign an address to the function pointer

int DoIt (float a, char b, char c){ return a+b+c; }
pt2Function = &DoIt; // assignment

Example:

int addC(char x, char y){
    return x+y;
}
int subC(char x, char y){
    return x-y;
}
int mulC(char x, char y){
    return x*y;
}
int divC(char x, char y){
    return x/y;
}
int modC(char x, char y){
    return x%y;
}

//array of pointer to functions that receive two chars and returns
int (*arrpf[]) (char, char) = { addC, subC, mulC, divC, modC};

int res;
char i;
void main() {
    for (i=0; i<5; i++){
        res = arrpf[i] (10, 20);
    }
}
**Pointer Arithmetic**

Pointer arithmetic in the *mikroC PRO for PIC* is limited to:

- assigning one pointer to another,
- comparing two pointers,
- comparing pointer to zero,
- adding/subtracting pointer and an integer value,
- subtracting two pointers.

The internal arithmetic performed on pointers depends on the memory specifier in force and the presence of any overriding pointer modifiers. When performing arithmetic with pointers, it is assumed that the pointer points to an array of objects.

**Arrays and pointers**

Arrays and pointers are not completely independent types in the *mikroC PRO for PIC*. When the name of an array comes up in expression evaluation (except with operators & and sizeof), it is implicitly converted to the pointer pointing to array's first element. Due to this fact, arrays are not modifiable lvalues.

Brackets [ ] indicate array subscripts. The expression

\[ id[exp] \]

is defined as

\[ *(id) + (exp) \]

where either:

- *id* is a pointer and *exp* is an integer, or
- *id* is an integer and *exp* is a pointer.

The following statements are true:

\[ \&a[i] = a + i \]
\[ a[i] = *(a + i) \]

According to these guidelines, it can be written:

\[ pa = \&a[4]; // pa points to a[4] \]
\[ x = *(pa + 3); // x = a[7] \]
\[ /* .. but: */ \]
\[ y = *pa + 3; // y = a[4] + 3 \]
Also the care should be taken when using operator precedence:

*pa++;       // Equal to *(pa++), increments the pointer
(*pa)++;     // Increments the pointed object!

The following examples are also valid, but better avoid this syntax as it can make the code really illegible:

(a + 1)[i] = 3;
// same as: *((a + 1) + i) = 3, i.e. a[i + 1] = 3

(i + 2)[a] = 0;
// same as: *((i + 2) + a) = 0, i.e. a[i + 2] = 0

Assignment and Comparison

The simple assignment operator (=) can be used to assign value of one pointer to another if they are of the same type. If they are of different types, you must use a typecast operator. Explicit type conversion is not necessary if one of the pointers is generic (of the void type).

Assigning the integer constant 0 to a pointer assigns a null pointer value to it.

Two pointers pointing to the same array may be compared by using relational operators ==, !=, <, <=, >, and >=. Results of these operations are the same as if they were used on subscript values of array elements in question:

int *pa = &a[4], *pb = &a[2];

if (pa == pb) { ... /* won't be executed as 4 is not equal to 2 */ }
if (pa > pb) { ... /* will be executed as 4 is greater than 2 */ }

You can also compare pointers to zero value – testing in that way if the pointer actually points to anything. All pointers can be successfully tested for equality or inequality to null:

if (pa == 0) { ... }
if (pb != 0) { ... }

Note: Comparing pointers pointing to different objects/arrays can be performed at programmer’s own responsibility — a precise overview of data’s physical storage is required.
**Pointer Addition**

You can use operators `+`, `++`, and `+=` to add an integral value to a pointer. The result of addition is defined only if the pointer points to an element of an array and if the result is a pointer pointing to the same array (or one element beyond it).

If a pointer is declared to point to `type`, adding an integral value `n` to the pointer increments the pointer value by `n * sizeof(type)` as long as the pointer remains within the legal range (first element to one beyond the last element). If `type` has a size of 10 bytes, then adding 5 to a pointer to `type` advances the pointer 50 bytes in memory. In case of the `type` type, the size of a step is one byte.

For example:

```c
int a[10];         /* array a containing 10 elements of type int */
int *pa = &a[0];   /* pa is pointer to int, pointing to a[0] */
*(pa + 3) = 6;     /* pa+3 is a pointer pointing to a[3], so a[3] now equals 6 */
pa++;              /* pa now points to the next element of array a: a[1] */
```

There is no such element as “one past the last element”, of course, but the pointer is allowed to assume such value. C “guarantees” that the result of addition is defined even when pointing to one element past array. If `P` points to the last array element, `P + 1` is legal, but `P + 2` is undefined.

This allows you to write loops which access the array elements in a sequence by means of incrementing pointer — in the last iteration you will have the pointer pointing to one element past the array, which is legal. However, applying an indirection operator (`*`) to a “pointer to one past the last element” leads to undefined behavior.

For example:

```c
void f (some_type a[], int n) {
    /* function f handles elements of array a; */
    /* array a has n elements of type some_type */
    int i;
    some_type *p=&a[0];

    for ( i = 0; i < n; i++ ) {
        /* .. here we do something with *p .. */
        p++;
        /* .. and with the last iteration p exceeds the last element of array a */
    }
    /* at this point, *p is undefined! */
}
```
**Pointer Subtraction**

Similar to addition, you can use operators -, --, and -= to subtract an integral value from a pointer.

Also, you may subtract two pointers. The difference will be equal to the distance between two pointed addresses, in bytes.

For example:

```c
int a[10];
int *pi1 = &a[0];
int *pi2 = &a[4];
i = pi2 - pi1; /* i equals 8 */
pi2 -= (i >> 1); /* pi2 = pi2 - 4: pi2 now points to [0] */
```
Structures

A structure is a derived type usually representing a user-defined collection of named members (or components). These members can be of any type, either fundamental or derived (with some restrictions to be discussed later), in any sequence. In addition, a structure member can be a bit field.

Unlike arrays, structures are considered to be single objects. The *mikroC PRO for PIC* structure type lets you handle complex data structures almost as easily as single variables.

**Note**: the *mikroC PRO for PIC* does not support anonymous structures (ANSI divergence).

Structure Declaration and Initialization

Structures are declared using the keyword `struct`:

```c
struct tag {member-declarator-list};
```

Here, `tag` is the name of a structure; `member-declarator-list` is a list of structure members, actually a list of variable declarations. Variables of structured type are declared the same as variables of any other type.

The member type cannot be the same as the struct type being currently declared. However, a member can be a pointer to the structure being declared, as in the following example:

```c
struct mystruct {mystruct s};  /* illegal! */
struct mystruct {mystruct *ps};  /* OK */
```

Also, a structure can contain previously defined structure types when declaring an instance of declared structure. Here is an example:

```c
/* Structure defining a dot: */
struct Dot { float x, y;};

/* Structure defining a circle: */
struct Circle {
    float r;
    struct Dot center;
} o1, o2;
/* declare variables o1 and o2 of Circle */
```
Note that the structure tag can be omitted, but then additional objects of this type cannot be declared elsewhere. For more information, see the Untagged Structures below.

Structure is initialized by assigning it a comma-delimited sequence of values within braces, similar to array. For example:

```c
/* Referring to declarations from the example above: */

/* Declare and initialize dots p and q: */
struct Dot p = {1., 1.}, q = {3.7, -0.5};

/* Declare and initialize circle o1: */
struct Circle o1 = {1., {0., 0.}};  // radius is 1, center is at (0, 0)
```

**Incomplete Declarations**

Incomplete declarations are also known as forward declarations. A pointer to a structure type `A` can legally appear in the declaration of another structure `B` before `A` has been declared:

```c
struct A;  // incomplete
struct B { struct A *pa;};
struct A { struct B *pb;};
```

The first appearance of `A` is called incomplete because there is no definition for it at that point. An incomplete declaration is allowed here, because the definition of `B` doesn’t need the size of `A`.

**Untagged Structures and Typedefs**

If the structure tag is omitted, an untagged structure is created. The untagged structures can be used to declare the identifiers in the comma-delimited member-declarator-list to be of the given structure type (or derived from it), but additional objects of this type cannot be declared elsewhere.

It is possible to create a typedef while declaring a structure, with or without tag:

```c
/* With tag: */
typedef struct mystruct { ... } Mystruct;
Mystruct s, *ps, arrs[10];  /* same as struct mystruct s, etc. */

/* Without tag: */
typedef struct { ... } Mystruct;
Mystruct s, *ps, arrs[10];
```

Usually, there is no need to use both tag and typedef: either can be used in structure type declarations.
Untagged structure and union members are ignored during initialization.

**Note:** See also Working with structures.

## WORKING WITH STRUCTURES

Structures represent user-defined types. A set of rules regarding the application of structures is strictly defined.

### Assignment

Variables of the same structured type may be assigned one to another by means of simple assignment operator (=). This will copy the entire contents of the variable to destination, regardless of the inner complexity of a given structure. Note that two variables are of the same structured type only if they are both defined by the same instruction or using the same type identifier. For example:

```c
/* a and b are of the same type: */
struct { int m1, m2; } a, b;

/* But c and d are _not_ of the same type although their structure descriptions are identical: */
struct { int m1, m2; } c;
struct { int m1, m2; } d;
```

### Size of Structure

The size of the structure in memory can be retrieved by means of the operator `sizeof`. It is not necessary that the size of the structure is equal to the sum of its members’ sizes. It is often greater due to certain limitations of memory storage.

### Structures and Functions

A function can return a structure type or a pointer to a structure type:

```c
mystuct func1(void);     /* func1() returns a structure */
mystuct *func2(void);    /* func2() returns pointer to structure */
```

A structure can be passed as an argument to a function in the following ways:

```c
void func1(mystuct s);   /* directly */
void func2(mystuct *sptr); /* via a pointer */
```
**Structure Member Access**

Structure and union members are accessed using the following two selection operators:

- `.` (period)
- `->` (right arrow)

The operator `. `is called the direct member selector and it is used to directly access one of the structure’s members. Suppose that the object `s` is of the struct type `S` and `m` is a member identifier of the type `M` declared in `s`, then the expression

```c
s.m   // direct access to member m
```

is of the type `M`, and represents the member object `m` in `S`.

The operator `->` is called the indirect (or pointer) member selector. Suppose that the object `s` is of the struct type `S` and `ps` is a pointer to `s`. Then if `m` is a member identifier of the type `M` declared in `s`, the expression

```c
ps->m   // indirect access to member m;
// identical to (*ps).m
```

is of the type `M`, and represents the member object `m` in `s`. The expression `ps->m` is a convenient shorthand for `(*ps).m`

For example:

```c
struct mystruct {
  int i;
  char str[21];
  double d;
} s, *sptr = &s;
...

s.i = 3;            // assign to the i member of mystruct s
sptr -> d = 1.23;   // assign to the d member of mystruct s
```

The expression `s.m` is lvalue, providing that `s` is lvalue and `m` is not an array type. The expression `sptr->m` is an lvalue unless `m` is an array type.
**Accessing Nested Structures**

If the structure `B` contains a field whose type is the structure `A`, the members of `A` can be accessed by two applications of the member selectors:

```c
struct A {
    int j; double x;
};
struct B {
    int i; struct A aa; double d;
} s, *sptr;
...
```

```c
s.i = 3;         // assign 3 to the i member of B
s.aa.j = 2;       // assign 2 to the j member of A
sptr->d = 1.23;   // assign 1.23 to the d member of B
sptr->aa.x = 3.14; // assign 3.14 to x member of A
```

**Structure Uniqueness**

Each structure declaration introduces a unique structure type, so that in

```c
struct A {
    int i,j; double d;
} aa, aaa;

struct B {
    int i,j; double d;
} bb;
```

the objects `aa` and `aaa` are both of the type `struct A`, but the objects `aa` and `bb` are of different structure types. Structures can be assigned only if the source and destination have the same type:

```c
aa = aaa;       /* OK: same type, member by member assignment */
aa = bb;        /* ILLEGAL: different types */
```

```c
/* but you can assign member by member: */
aa.i = bb.i;
aa.j = bb.j;
aa.d = bb.d;
```
Unions

Union types are derived types sharing many of syntactic and functional features of structure types. The key difference is that a union members share the same memory space.

Note: The mikroC PRO for PIC does not support anonymous unions (ANSI divergence).

Unions Declaration

Unions have the same declaration as structures, with the keyword `union` used instead of `struct`

```
union tag { member-declarator-list };
```

Unlike structures’ members, the value of only one of union’s members can be stored at any time. Here is a simple example:

```
union myunion {  // union tag is 'myunion'
    int i;
    double d;
    char ch;
} mu, *pm;
```

The identifier `mu`, of the type `myunion`, can be used to hold a 2-byte `int`, 4-byte `double` or single-byte `char`, but only one of them at a certain moment. The identifier `pm` is a pointer to union `myunion`.

Size of Union

The size of a union is the size of its largest member. In our previous example, both `sizeof(union myunion)` and `sizeof(mu)` return 4, but 2 bytes are unused (padded) when `mu` holds the `int` object, and 3 bytes are unused when `mu` holds `char`.

Union Member Access

Union members can be accessed with the structure member selectors (., and ->), be careful when doing this:

```
/* Referring to declarations from the example above: */
pm = &mu;
mu.d = 4.016;
tmp = mu.d;  // OK: mu.d = 4.016
```
tmp = mu.i;  // peculiar result

pm->i = 3;
tmp = mu.i;  // OK: mu.i = 3

The third line is legal, since `mu.i` is an integral type. However, the bit pattern in `mu.i` corresponds to parts of the previously assigned `double`. As such, it probably won't provide an useful integer interpretation.

When properly converted, a pointer to a union points to each of its members, and vice versa.

**Bit Fields**

Bit fields are specified numbers of bits that may or may not have an associated identifier. Bit fields offer a way of subdividing structures into named parts of user-defined sizes.

Structures and unions can contain bit fields that can be up to 16 bits.

You cannot take the address of a bit field.

**Note:** If you need to handle specific bits of 8-bit variables (`char` and `unsigned short`) or registers, you don’t need to declare bit fields. Much more elegant solution is to use the *mikroC PRO for PIC*’s intrinsic ability for individual bit access — see Accessing Individual Bits for more information.

**Bit Fields Declaration**

Bit fields can be declared only in structures and unions. Declare a structure normally and assign individual fields like this (fields need to be `unsigned`):

```c
struct tag {
    unsigned bitfield-declarator-list;
}
```

Here, `tag` is an optional name of the structure; `bitfield-declarator-list` is a list of bit fields. Each component identifier requires a colon and its width in bits to be explicitly specified. Total width of all components cannot exceed two bytes (16 bits).

As an object, bit fields structure takes two bytes. Individual fields are packed within two bytes from right to left. In `bitfield-declarator-list`, you can omit identifier(s) to create an artificial “padding”, thus skipping irrelevant bits.
For example, if there is a need to manipulate only bits 2–4 of a register as one block, create a structure like this:

```c
struct {
    unsigned : 2, // Skip bits 0 and 1, no identifier here
    mybits : 3;  // Relevant bits 2, 3 and 4
    // Bits 5, 6 and 7 are implicitly left out
} myreg;
```

Here is an example:

```c
typedef struct {
    lo_nibble : 4;
    hi_nibble : 4;
    high_byte : 8;}
myunsigned;
```

which declares the structured type `myunsigned` containing three components: `lo_nibble` (bits 3..0), `hi_nibble` (bits 7..4) and `high_byte` (bits 15..8).

**Bit Fields Access**

Bit fields can be accessed in the same way as the structure members. Use direct and indirect member selector (. and ->). For example, we could work with our previously declared `myunsigned` like this:

```c
// This example writes low byte of bit field of myunsigned type to PORT0:
myunsigned Value_For_PORT0;

void main() {
    ...
    Value_For_PORT0.lo_nibble = 7;
    Value_For_PORT0.hi_nibble = 0x0C;
    P0 = *(char *)&Value_For_PORT0;
    // typecasting :
    // 1. address of structure to pointer to void
    // 2. pointer to void to pointer to char
    // 3. dereferencing to obtain the value
}
```
**Type Conversions**

The *mikroC PRO for PIC* is a strictly typed language, with each operator, statement and function demanding appropriately typed operands/arguments. However, we often have to use objects of “mismatching” types in expressions. In that case, *type conversion* is needed.

Conversion of object of one type means that object's type is changed into another type. The *mikroC PRO for PIC* defines a set of standard conversions for built-in types, provided by compiler when necessary. For more information, refer to the Standard Conversions.

Conversion is required in the following situations:

- if a statement requires an expression of particular type (according to language definition), and we use an expression of different type,
- if an operator requires an operand of particular type, and we use an operand of different type,
- if a function requires a formal parameter of particular type, and we pass it an object of different type,
- if an expression following the keyword `return` does not match the declared function return type,
- if initialising an object (in declaration) with an object of different type.

In these situations, compiler will provide an automatic implicit conversion of types, without any programmer's interference. Also, the programmer can demand conversion explicitly by means of the *typecast* operator. For more information, refer to the Explicit Typecasting.

**Standard Conversions**

When using arithmetic expression, such as \( a + b \), where \( a \) and \( b \) are of different arithmetic types, the *mikroC PRO for PIC* performs implicit type conversions before the expression is evaluated. These standard conversions include promotions of “lower” types to “higher” types in the interests of accuracy and consistency.

Assigning a signed character object (such as a variable) to an integral object results in automatic sign extension. Objects of type signed char always use sign extension; objects of type unsigned char always has its high byte set to zero when converted to int.

Converting a longer integral type to a shorter type truncates the higher order bits and leaves low-order bits unchanged. Converting a shorter integral type to a longer type either sign-extends or zero-fills the extra bits of the new value, depending on whether the shorter type is signed or unsigned, respectively.
Note: Conversion of floating point data into integral value (in assignments or via explicit typecast) produces correct results only if the `float` value does not exceed the scope of destination integral type.

Details:

Here are the steps the *mikroC PRO for PIC* uses to convert the operands in an arithmetic expression:

First, any small integral types are converted according to the following rules:

1. `char` converts to `int`
2. `signed char` converts to `int`, with the same value
3. `short` converts to `int`, with the same value, sign-extended
4. `unsigned short` converts to `int`, with the same value, zero-filled
5. `enum` converts to `int`, with the same value

After this, any two values associated with an operator are either `int` (including the `long` and `unsigned` modifiers) or `float` (equivalent with `double` and `long double` in the mikroC PRO for PIC).

1. If either operand is `float`, the other operand is converted to `float`.
2. Otherwise, if either operand is `unsigned long`, the other operand is converted to `unsigned long`.
3. Otherwise, if either operand is `long`, then the other operand is converted to `long`.
4. Otherwise, if either operand is `unsigned`, then the other operand is converted to `unsigned`.
5. Otherwise, both operands are `int`.

The result of the expression is the same type as that of the two operands.

Here are several examples of implicit conversion:

\[
\begin{align*}
2 + 3.1 & \quad /* \ ? 2. + 3.1 \ ? 5.1 */ \\
5 / 4 * 3. & \quad /* \ ? (5/4)*3. \ ? 1*3. \ ? 1.3. \ ? 3. */ \\
3. * 5 / 4 & \quad /* \ ? (3.*5)/4 \ ? (3.*5.)/4 \ ? 15./4 \ ? 15./4. \ ? 3.75 */
\end{align*}
\]

**Pointer Conversion**

Pointer types can be converted to other pointer types using the typecasting mechanism:

```c
char *str;
int *ip;
str = (char *)ip;
```

More generally, the cast `type*` will convert a pointer to type “pointer to `type`”.

192 MIKROELEKTRONIKA - SOFTWARE AND HARDWARE SOLUTIONS FOR EMBEDDED WORLD
Explicit Type Conversions (Typecasting)

In most situations, compiler will provide an automatic implicit conversion of types where needed, without any user's interference. Also, the user can explicitly convert an operand to another type using the prefix unary *typecast* operator:

```
(type) object
```

This will convert `object` to a specified `type`. Parentheses are mandatory.

For example:

```c
/* Let's have two variables of char type: */
char a, b;

/* Following line will coerce a to unsigned int: */
(unsigned int) a;

/* Following line will coerce a to double,
then coerce b to double automatically,
resulting in double type value: */
(double) a + b;   // equivalent to ((double) a) + b;
```

Declarations

A declaration introduces one or several names to a program – it informs the compiler what the name represents, what its type is, what operations are allowed with it, etc. This section reviews concepts related to declarations: declarations, definitions, declaration specifiers, and initialization.

The range of objects that can be declared includes:

- Variables
- Constants
- Functions
- Types
- Structure, union and enumeration tags
- Structure members
- Union members
- Arrays of other types
- Statement labels
- Preprocessor macros
Declarations and Definitions

Defining declarations, also known as definitions, beside introducing the name of an object, also establish the creation (where and when) of an object; that is, the allocation of physical memory and its possible initialization. Referencing declarations, or just declarations, simply make their identifiers and types known to the compiler.

Here is an overview. Declaration is also a definition, except if:
- it declares a function without specifying its body
- it has the `extern` specifier, and has no initializator or body (in case of func.)
- it is the `typedef` declaration

There can be many referencing declarations for the same identifier, especially in a multifile program, but only one defining declaration for that identifier is allowed.

For example:

```c
/* Here is a nondefining declaration of function max; */
/* it merely informs compiler that max is a function */
int max();

/* Here is a definition of function max: */
int max(int x, int y) {
    return (x >= y) ? x : y;
}

/* Definition of variable i: */
int i;

/* Following line is an error, i is already defined! */
int i;
```

Declarations and Declarators

The declaration contains specifier(s) followed by one or more identifiers (declarators). The declaration begins with optional storage class specifiers, type specifiers, and other modifiers. The identifiers are separated by commas and the list is terminated by a semicolon.

Declarations of variable identifiers have the following pattern:

```
storage-class [ type-qualifier] type var1 [=init1], var2 [=init2], ... ;
```

where var1, var2,... are any sequence of distinct identifiers with optional initializers. Each of the variables is declared to be of type; if omitted, type defaults to int. The specifier storage-class can take the values extern, static, register, or the
default auto. Optional type-qualifier can take values const or volatile. For more details, refer to Storage Classes and Type Qualifiers.

For example:

/* Create 3 integer variables called x, y, and z and initialize x and y to the values 1 and 2, respectively: */
int x = 1, y = 2, z;   // z remains uninitialized

/* Create a floating-point variable q with static modifier, and initialize it to 0.25: */
static float q = .25;

These are all defining declarations; storage is allocated and any optional initializers are applied.

**Linkage**

An executable program is usually created by compiling several independent translation units, then linking the resulting object files with preexisting libraries. A term translation unit refers to a source code file together with any included files, but without the source lines omitted by conditional preprocessor directives. A problem arises when the same identifier is declared in different scopes (for example, in different files), or declared more than once in the same scope.

The linkage is a process that allows each instance of an identifier to be associated correctly with one particular object or function. All identifiers have one of two linkage attributes, closely related to their scope: external linkage or internal linkage. These attributes are determined by the placement and format of your declarations, together with an explicit (or implicit by default) use of the storage class specifier static or extern.

Each instance of a particular identifier with external linkage represents the same object or function throughout the entire set of files and libraries making up the program. Each instance of a particular identifier with internal linkage represents the same object or function within one file only.

**Linkage Rules**

Local names have internal linkage; the same identifier can be used in different files to signify different objects. Global names have external linkage; identifier signifies the same object throughout all program files.

If the same identifier appears with both internal and external linkage within the same file, the identifier will have internal linkage.
Internal Linkage Rules

1. names having file scope, explicitly declared as `static`, have internal linkage
2. names having file scope, explicitly declared as `const` and not explicitly declared as `extern`, have internal linkage
3. `typedef` names have internal linkage
4. enumeration constants have internal linkage

External Linkage Rules

1. names having file scope, that do not comply to any of previously stated internal linkage rules, have external linkage

The storage class specifiers `auto` and `register` cannot appear in an external declaration. No more than one external definition can be given for each identifier in a translation unit declared with internal linkage. An external definition is an external declaration that defines an object or a function and also allocates a storage. If an identifier declared with external linkage is used in an expression (other than as part of the operand of `sizeof`), then exactly one external definition of that identifier must be somewhere in the entire program.

Storage Classes

Associating identifiers with objects requires each identifier to have at least two attributes: storage class and type (sometimes referred to as data type). The `mikroC PRO for PIC` compiler deduces these attributes from implicit or explicit declarations in the source code.

A storage class dictates the location (data segment, register, heap, or stack) of object and its duration or lifetime (the entire running time of the program, or during execution of some blocks of code). A storage class can be established by the syntax of a declaration, by its placement in the source code, or by both of these factors:

```
storage-class type identifier
```

The storage class specifiers in the `mikroC PRO for PIC` are:

- auto
- register
- static
- extern
Auto
The auto modifier is used to define that a local variable has a local duration. This is the default for local variables and is rarely used. auto can not be used with globals. See also Functions.

Register
At the moment the modifier register technically has no special meaning. The mikroC PRO for PIC compiler simply ignores requests for register allocation.

Static
A global name declared with the static specifier has internal linkage, meaning that it is local for a given file. See Linkage for more information.

A local name declared with the static specifier has static duration. Use static with a local variable to preserve the last value between successive calls to that function. See Duration for more information.

Extern
A name declared with the extern specifier has external linkage, unless it has been previously declared as having internal linkage. A declaration is not a definition if it has the extern specifier and is not initialized. The keyword extern is optional for a function prototype.

Use the extern modifier to indicate that the actual storage and initial value of the variable, or body of the function, is defined in a separate source code module. Functions declared with extern are visible throughout all source files in the program, unless the function is redefined as static.

See Linkage for more information.

Type Qualifiers
The type qualifiers const and volatile are optional in declarations and do not actually affect the type of declared object.

Qualifiers Const
The qualifier const implies that a declared object will not change its value during runtime. In declarations with the const qualifier all objects need to be initialized.

The mikroC PRO for PIC treats objects declared with the const qualifier the same as literals or preprocessor constants. If the user tries to change an object declared with the const qualifier compiler will report an error.
For example:

    const double PI = 3.14159;

**Qualifier Volatile**

The qualifier `volatile` implies that a variable may change its value during runtime independently from the program. Use the volatile modifier to indicate that a variable can be changed by a background routine, an interrupt routine, or I/O port. Declaring an object to be volatile warns the compiler not to make assumptions concerning the value of an object while evaluating expressions in which it occurs because the value could be changed at any moment.

**Typedef Specifier**

The specifier `typedef` introduces a synonym for a specified type. The typedef declarations are used to construct shorter or more convenient names for types already defined by the language or declared by the user. The specifier `typedef` stands first in the declaration:

    typedef <type_definition> synonym;

The `typedef` keyword assigns synonym to `<type_definition>`. The `synonym` needs to be a valid identifier.

A declaration starting with the `typedef` specifier does not introduce an object or a function of a given type, but rather a new name for a given type. In other words, the typedef declaration is identical to a "normal" declaration, but instead of objects, it declares types. It is a common practice to name custom type identifiers with starting capital letter — this is not required by the mikroC PRO for PIC. For example:

    /* Let's declare a synonym for "unsigned long int" */
    typedef unsigned long int Distance;

    /* Now, synonym "Distance" can be used as type identifier: */
    Distance i; // declare variable i of unsigned long int

In the `typedef` declaration, as in any other declaration, several types can be declared at once. For example:

    typedef int *Pti, Array[10];

Here, `Pti` is a synonym for type “pointer to int”, and `Array` is a synonym for type “array of 10 int elements”.

**asm Declarations**
The *mikroC PRO for PIC* allows embedding assembly in the source code by means of the `asm` declaration. The declarations `_asm` and `_asm` are also allowed in the *mikroC PRO for PIC* and have the same meaning. Note that numerals cannot be used as absolute addresses for SFR or GPR variables in assembly instructions. Symbolic names may be used instead (listing will display these names as well as addresses).

Assembly instructions can be grouped by the `asm` keyword (or `_`, or `_asm`):

```c
asm {
    block of assembly instructions
}
```

There are two ways to embedding single assembly instruction to C code:

```c
asm assembly instruction;
```

and

```c
asm assembly instruction
```

**Note:** semicolon and LF are terminating asm scope for single assembly instructions. This is the reason why the following syntax is not asm block:

```c
asm
{
    block of assembly instructions
}
```

This code will be interpreted as single empty asm line followed by C compound statement.

The *mikroC PRO for PIC* comments (both single-line and multi-line) are allowed in embedded assembly code.

If you have a global variable "g_var", that is of type long (i.e. 4 bytes), you are to access it like this:

```c
MOVF _g_var+0, 0 ;puts least-significant byte of _g_var in W register
MOVF _g_var+1, 0 ;second byte of _g_var; corresponds to Hi(g_var)
MOVF _g_var+2, 0 ;Higher(g_var)
MOVF _g_var+3, 0 ;Highest(g_var)
... etc.
```

If you want to know details aboutasm syntax supported by *mikroC PRO for PIC* it is recommended to study `asm` and lst files generated by compiler. It is also recommend-ed to check "Include source lines in output files" checkbox in Output settings.
Note: Compiler doesn't expect memory banks to be changed inside the assembly code. If the user wants to do this, then he must restore the previous bank selection.

**Initialization**

The initial value of a declared object can be set at the time of declaration (*initialization*). A part of the declaration which specifies the initialization is called *initializer*.

Initializers for globals and static objects must be constants or constant expressions. The initializer for an automatic object can be any legal expression that evaluates to an assignment-compatible value for the type of the variable involved.

Scalar types are initialized with a single expression, which can optionally be enclosed in braces. The initial value of an object is that of the expression; the same constraints for type and conversions as for simple assignments are applied to initializations too.

For example:

```c
int i = 1;
char *s = "hello";
struct complex c = {0.1, -0.2};
// where 'complex' is a structure (float, float)
```

For structures or unions with automatic storage duration, the initializer must be one of the following:

- An initializer list.
- A single expression with compatible union or structure type. In this case, the initial value of the object is that of the expression.

For example:

```c
struct dot { int x; int y; } m = {30, 40};
```

For more information, refer to Structures and Unions.

Also, you can initialize arrays of character type with a literal string, optionally enclosed in braces. Each character in the string, including the null terminator, initializes successive elements in the array. For more information, refer to Arrays.

**Automatic Initialization**

The *mikroC PRO for PIC* does not provide automatic initialization for objects. Unini-
initialized globals and objects with static duration will take random values from memory.

**FUNCTIONS**

Functions are central to C programming. Functions are usually defined as subprograms which return a value based on a number of input parameters. Return value of the function can be used in expressions – technically, function call is considered to be an expression like any other.

C allows a function to create results other than its return value, referred to as *side effects*. Often, the function return value is not used at all, depending on the side effects. These functions are equivalent to *procedures* of other programming languages, such as Pascal. C does not distinguish between procedure and function – functions play both roles.

Each program must have a single external function named `main` marking the entry point of the program. Functions are usually declared as prototypes in standard or user-supplied header files, or within program files. Functions have external linkage by default and are normally accessible from any file in the program. This can be restricted by using the `static` storage class specifier in function declaration (see Storage Classes and Linkage).

**Note**: Check the PIC Specifics for more information on functions' limitations on the PIC compliant MCUs.

**Function Declaration**

Functions are declared in user's source files or made available by linking precompiled libraries. The declaration syntax of the function is:

```
type function_name(parameter-declarator-list);
```

The `function_name` must be a valid identifier. This name is used to call the function; see Function Calls for more information.

`type` represents the type of function result, and can be of any standard or user-defined type. For functions that do not return value the `void` type should be used. The type can be omitted in global function declarations, and function will assume the `int` type by default.

Function type can also be a pointer. For example, `float*` means that a function result is a pointer to `float`. The generic pointer `void*` is also allowed.
The function cannot return an array or another function.

Within parentheses, parameter-declarator-list is a list of formal arguments that function takes. These declarators specify the type of each function parameter. The compiler uses this information to check validity of function calls. If the list is empty, a function does not take any arguments. Also, if the list is void, a function also does not take any arguments; note that this is the only case when void can be used as an argument's type.

Unlike variable declaration, each argument in the list needs its own type specifier and possible qualifier const or volatile.

**Function Prototype**

A function can be defined only once in the program, but can be declared several times, assuming that the declarations are compatible. When declaring a function, the formal argument's identifier does not have to be specified, but its type does.

This kind of declaration, commonly known as the function prototype, allows better control over argument number, type checking and type conversions. The name of a parameter in function prototype has its scope limited to the prototype. This allows one parameter identifier to have different name in different declarations of the same function:

```c
/* Here are two prototypes of the same function: */
int test(const char*)  /* declares function test */
int test(const char*p) /* declares the same function test */
```

Function prototypes are very useful in documenting code. For example, the function Cﬁ_Init takes two parameters: Control Port and Data Port. The question is, which is which? The function prototype:

```c
void Cﬁ_Init(char *ctrlport, char *dataport);
```

makes it clear. If a header file contains function prototypes, the user can read that file to get the information needed for writing programs that call these functions. If a prototype parameter includes an identifier, then the indentifer is only used for error checking.
Function Definition

Function definition consists of its declaration and function body. The function body is technically a block—a sequence of local definitions and statements enclosed within braces. All variables declared within function body are local to the function, i.e., they have function scope.

The function itself can be defined only within the file scope, which means that function declarations cannot be nested.

To return the function result, use the return statement. The statement return in functions of the void type cannot have a parameter—in fact, the return statement can be omitted altogether if it is the last statement in the function body.

Here is a sample function definition:

/* function max returns greater one of its 2 arguments: */

int max(int x, int y) {
  return (x>=y) ? x : y;
}

Here is a sample function which depends on side effects rather than return value:

/* function converts Descartes coordinates (x,y) to polar (r,fi): */
#include <math.h>

void polar(double x, double y, double *r, double *fi) {
  *r = sqrt(x * x + y * y);
  *fi = (x == 0 && y == 0) ? 0 : atan2(y, x);
  return; /* this line can be omitted */
}

Function Reentrancy

Functions reentrancy is allowed if the function has no parameters and local variables, or if the local variables are placed in the Rx space. Remember that the PIC has stack and memory limitations which can vary greatly between MCUs.
Function Calls and Argument Conversion

Function Calls

A function is called with actual arguments placed in the same sequence as their matching formal parameters. Use the function-call operator ():

```
function_name(expression_1, ... , expression_n)
```

Each expression in the function call is an actual argument. Number and types of actual arguments should match those of formal function parameters. If types do not match, implicit type conversions rules will be applied. Actual arguments can be of any complexity, but order of their evaluation is not specified.

Upon function call, all formal parameters are created as local objects initialized by the values of actual arguments. Upon return from a function, a temporary object is created in the place of the call, and it is initialized by the expression of the return statement. This means that the function call as an operand in complex expression is treated as a function result.

If the function has no result (type void) or the result is not needed, then the function call can be written as a self-contained expression.

In C, scalar arguments are always passed to the function by value. The function can modify the values of its formal parameters, but this has no effect on the actual arguments in the calling routine. A scalar object can be passed by the address if a formal parameter is declared as a pointer. The pointed object can be accessed by using the indirection operator *.

```
// For example, Soft_Uart_Read takes the pointer to error variable, // so it can change the value of an actual argument:
Soft_Uart_Read(&error);

// The following code would be wrong; you would pass the value // of error variable to the function:
Soft_Uart_Read(error);
```

Argument Conversions

If a function prototype has not been previously declared, the mikroC PRO for PIC converts integral arguments to a function call according to the integral widening (expansion) rules described in Standard Conversions. If a function prototype is in scope, the mikroC PRO for PIC converts the passed argument to the type of the declared parameter according to the same conversion rules as in assignment statements.
If a prototype is present, the number of arguments must match. The types need to be compatible only to the extent that an assignment can legally convert them. The user can always use an explicit cast to convert an argument to a type that is acceptable to a function prototype.

**Note:** If the function prototype does not match the actual function definition, the _mikroC PRO for PIC_ will detect this if and only if that definition is in the same compilation unit as the prototype. If you create a library of routines with the corresponding header file of prototypes, consider including that header file when you compile the library, so that any discrepancies between the prototypes and actual definitions will be detected.

The compiler is also able to force arguments to change their type to a proper one. Consider the following code:

```c
int limit = 32;
char ch = 'A';
long res;

// prototype
extern long func(long par1, long par2);

main() {
  ...
  res = func(limit, ch);  // function call
}
```

Since the program has the function prototype for `func`, it converts `limit` and `ch` to `long`, using the standard rules of assignment, before it places them on the stack for the call to `func`.

Without the function prototype, `limit` and `ch` would be placed on the stack as an integer and a character, respectively; in that case, the stack passed to `func` will not match size or content that `func` expects, which can cause problems.

### Ellipsis ("...") Operator

The ellipsis ("...") consists of three successive periods with no whitespace intervening. An ellipsis can be used in the formal argument lists of function prototypes to indicate a variable number of arguments, or arguments with varying types. For example:

```c
void func (int n, char ch, ...);
```

This declaration indicates that `func` will be defined in such a way that calls must have at least two arguments, `int` and `char`, but can also have any number of additional arguments.
Example:

```c
#include <stdarg.h>

int addvararg(char a1,...){
    va_list ap;
    va_start(ap,a1);
    char temp;
    while( temp = va_arg(ap,char))
        a1 += temp;
    return a1;
}

int res;
void main() {
    res = addvararg(1,2,3,4,5,0);
    res = addvararg(1,2,3,4,5,6,7,8,9,10,0);
}
```
OPERATORS

Operators are tokens that trigger some computation when applied to variables and other objects in an expression.

- Arithmetic Operators
- Assignment Operators
- Bitwise Operators
- Logical Operators
- Reference/Indirect Operators
- Relational Operators
- Structure Member Selectors

- Comma Operator ,
- Conditional Operator ? :

- Array subscript operator []
- Function call operator ()

- `sizeof` Operator

- Preprocessor Operators # and ##
Operators Precedence and Associativity

There are 15 precedence categories, some of them contain only one operator. Operators in the same category have equal precedence.

If duplicates of operators appear in the table, the first occurrence is unary and the second binary. Each category has an associativity rule: left-to-right (→), or right-to-left (←). In the absence of parentheses, these rules resolve a grouping of expressions with operators of equal precedence.

Arithmetic Operators

Arithmetic operators are used to perform mathematical computations. They have numerical operands and return numerical results. The type char technically represents small integers, so the char variables can be used as operands in arithmetic operations.

All arithmetic operators associate from left to right.
### Operator Table

<table>
<thead>
<tr>
<th>Operator</th>
<th>Operation</th>

<td>14</td>
</tr>
<tr>
<td>-</td>
<td>unary minus changes the sign of the operand</td>
<td>14</td>
</tr>
<tr>
<td>++</td>
<td>increment adds one to the value of the operand. Postincrement adds one to the value of the operand after it evaluates; while preincrement adds one before it evaluates</td>
<td>14</td>
</tr>
<tr>
<td>--</td>
<td>decrement subtracts one from the value of the operand. Postdecrement subtracts one from the value of the operand after it evaluates; while predecrement subtracts one before it evaluates</td>
<td>14</td>
</tr>
</tbody>
</table>

Note: Operator * is context sensitive and can also represent the pointer reference operator.
Binary Arithmetic Operators

Division of two integers returns an integer, while remainder is simply truncated:

```c
/* for example: */
7 / 4;          /* equals 1 */
7 * 3 / 4;      /* equals 5 */
/* but: */
7. * 3. / 4.;   /* equals 5.25 because we are working with floats */
```

Remainder operand % works only with integers; the sign of result is equal to the sign of the first operand:

```c
/* for example: */
9 % 3;          /* equals 0 */
7 % 3;          /* equals 1 */
-7 % 3;         /* equals -1 */
```

Arithmetic operators can be used for manipulating characters:

```c
'A' + 32;          /* equals 'a' (ASCII only) */
'G' - 'A' + 'a';   /* equals 'g' (both ASCII and EBCDIC) */
```

Unary Arithmetic Operators

Unary operators ++ and -- are the only operators in C which can be either prefix (e.g. ++k, --k) or postfix (e.g. k++, k--).

When used as prefix, operators ++ and -- (preincrement and predecrement) add or subtract one from the value of the operand before the evaluation. When used as suffix, operators ++ and -- (postincrement and postdecrement) add or subtract one from the value of the operand after the evaluation.

For example:

```c
int j = 5;
j = ++k;       /* k = k + 1, j = k, which gives us j = 6, k = 6 */
```

but:

```c
int j = 5;
j = k++;      /* j = k, k = k + 1, which gives us j = 5, k = 6 */
```
Relational Operators

Use relational operators to test equality or inequality of expressions. If an expression evaluates to be true, it returns 1; otherwise it returns 0.

All relational operators associate from left to right.

Relational Operators Overview

<table>
<thead>
<tr>
<th>Operator</th>
<th>Operation</th>

</tr>
<tr>
<td>&gt;=</td>
<td>greater than or equal</td>
<td>10</td>
</tr>
<tr>
<td>&lt;=</td>
<td>less than or equal</td>
<td>10</td>
</tr>
</tbody>
</table>

Relational Operators in Expressions

Precedence of arithmetic and relational operators is designated in such a way to allow complex expressions without parentheses to have expected meaning:

```
a + 5 >= c - 1.0 / e   /* ? (a + 5) >= (c - (1.0 / e)) */
```

Do not forget that relational operators return either 0 or 1. Consider the following examples:

```
/* ok: */
5 > 7                  /* returns 0 */
10 <= 20               /* returns 1 */

/* this can be tricky: */
8 == 13 > 5            /* returns 0, as: 8 == (13 > 5) ? 8 == 1 */
? 0 */
14 > 5 < 3             /* returns 1, as: (14 > 5) < 3 ? 1 < 3 ? 1 */
a < b < 5              /* returns 1, as: (a < b) < 5 ? (0 or 1) */
< 5 ? 1*/
```
Bitwise Operators

Use the bitwise operators to modify individual bits of numerical operands.

Bitwise operators associate from left to right. The only exception is the bitwise complement operator ~ which associates from right to left.

Bitwise Operators Overview

<table>
<thead>
<tr>
<th>Operator</th>

<td>0</td>
</tr>
</tbody>
</table>

Bitwise operators &, | and ^ perform logical operations on the appropriate pairs of bits of their operands. Operator ~ complements each bit of its operand. For example:
0x1234 & 0x5678     /* equals 0x1230 */

/* because ..

0x1234 : 0001 0010 0011 0100
0x5678 : 0101 0110 0111 1000
----------------------------
& : 0001 0010 0011 0000
.. that is, 0x1230 */

/* Similarly: */

0x1234 | 0x5678;     /* equals 0x567C */
0x1234 ^ 0x5678;    /* equals 0x444C */
~ 0x1234;           /* equals 0xEDCB */

Note: Operator & can also be a pointer reference operator. Refer to Pointers for more information.

Bitwise Shift Operators

Binary operators << and >> move the bits of the left operand by a number of positions specified by the right operand, to the left or right, respectively. Right operand has to be positive.

With shift left (<<), far left bits are discarded and “new” bits on the right are assigned zeroes. Thus, shifting unsigned operand to the left by \( n \) positions is equivalent to multiplying it by \( 2^n \) if all discarded bits are zero. This is also true for signed operands if all discarded bits are equal to a sign bit.

000001 << 5; /* equals 000040 */
0x3801 << 4; /* equals 0x8010, overflow! */

With shift right (>>, far right bits are discarded and the “freed” bits on the left are assigned zeroes (in case of unsigned operand) or the value of a sign bit (in case of signed operand). Shifting operand to the right by \( n \) positions is equivalent to dividing it by \( 2^n \).

0xFFF56 >> 4;       /* equals 0xFFF5 */
0xFFF56u >> 4;      /* equals 0x0FF5 */
Bitwise versus Logical

Do not forget of the principle difference between how bitwise and logical operators work. For example:

\[
\begin{align*}
0222222 \ & \ 0555555; & \text{equals} & \ 000000 */
0222222 \ & \ 0555555; & \text{equals} & \ 1 */
~ 0x1234; & \text{equals} & 0xEDCB */
! 0x1234; & \text{equals} & 0 */
\end{align*}
\]

Logical Operators

Operands of logical operations are considered true or false, that is non-zero or zero. Logical operators always return 1 or 0. Operands in a logical expression must be of scalar type.

Logical operators && and || associate from left to right. Logical negation operator ! associates from right to left.

Logical Operators Overview

<table>
<thead>
<tr>
<th>Operator</th>
<th>Operation</th>
<th>Precedence</th>
</tr>
</thead>
<tbody>
<tr>
<td>&amp;&amp;</td>
<td>logical AND</td>
<td>5</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>!</td>
<td>logical negation</td>
<td>14</td>
</tr>
</tbody>
</table>

Logical Operators

<table>
<thead>
<tr>
<th>&amp;&amp;</th>
<th>0</th>
<th>x</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
<td>1</td>
</tr>
</tbody>
</table>

| || | 0 | x |
|----|---|---|
| 0  | 0 | 1 |
| x  | 1 | 1 |

<table>
<thead>
<tr>
<th>!</th>
<th>0</th>
<th>x</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

Precedence of logical, relational, and arithmetic operators was designated in such a way to allow complex expressions without parentheses to have an expected meaning:

\[
\begin{align*}
c \geq '0' \ && \ c \leq '9'; & \text{ reads as: } & (c \geq '0') \ && (c \leq '9') */
a + 1 \ == \ b \ || \ ! f(x); & \text{ reads as: } & ((a + 1) \ == \ b) \ || \ (! (f(x))) */
\end{align*}
\]

Logical AND && returns 1 only if both expressions evaluate to be nonzero, otherwise
returns 0. If the first expression evaluates to false, the second expression will not be evaluated. For example:

```c
a > b && c < d;    /* reads as  (a > b) && (c < d) */
/* if (a > b) is false (0), (c < d) will not be evaluated */
```

Logical OR || returns 1 if either of expression evaluates to be nonzero, otherwise returns 0. If the first expression evaluates to true, the second expression is not evaluated. For example:

```c
a && b || c && d;  /* reads as: (a && b) || (c && d) */
/* if (a && b) is true (1), (c && d) will not be evaluated */
```

### Logical Expressions and Side Effects

General rule regarding complex logical expressions is that the evaluation of consecutive logical operands stops at the very moment the final result is known. For example, if we have an expression `a && b && c` where `a` is false (0), then operands `b` and `c` will not be evaluated. This is very important if `b` and `c` are expressions, as their possible side effects will not take place!

### Logical versus Bitwise

Be aware of the principle difference between how bitwise and logical operators work. For example:

```c
0222222 & 0555555     /* equals 000000 */
0222222 && 0555555     /* equals 1 */
~ 0x1234               /* equals 0xEDCB */
! 0x1234               /* equals 0 */
```
Conditional Operator \( ? : \)

The conditional operator \( ? : \) is the only ternary operator in C. Syntax of the conditional operator is:

\[
\text{expression1} \ ? \ \text{expression2} : \ \text{expression3}
\]

The \text{expression1} is evaluated first. If its value is true, then \text{expression2} evaluates and \text{expression3} is ignored. If \text{expression1} evaluates to false, then \text{expression3} evaluates and \text{expression2} is ignored. The result will be a value of either \text{expression2} or \text{expression3} depending upon which of them evaluates.

**Note:** The fact that only one of these two expressions evaluates is very important if they are expected to produce side effects!

Conditional operator associates from right to left. Here are a couple of practical examples:

```c
/* Find max(a, b): */
max = ( a > b ) ? a : b;

/* Convert small letter to capital: */
/* (no parentheses are actually necessary) */
c = ( c >= 'a' && c <= 'z' ) ? ( c - 32 ) : c;
```

**Conditional Operator Rules**

\text{expression1} must be a scalar expression; \text{expression2} and \text{expression3} must obey one of the following rules:

1. Both expressions have to be of arithmetic type. \text{expression2} and \text{expression3} are subject to usual arithmetic conversions, which determines the resulting type.
2. Both expressions have to be of compatible struct or union types. The resulting type is a structure or union type of \text{expression2} and \text{expression3}.
3. Both expressions have to be of \text{void} type. The resulting type is \text{void}.
4. Both expressions have to be of type pointer to qualified or unqualified versions of compatible types. The resulting type is a pointer to a type qualified with all type qualifiers of the types pointed to by both expressions.
5. One expression is a pointer, and the other is a null pointer constant. The resulting type is a pointer to a type qualified with all type qualifiers of the types pointed to by both expressions.
6. One expression is a pointer to an object or incomplete type, and the other is a pointer to a qualified or unqualified version of \text{void}. The resulting type is that of the non-pointer-to-\text{void} expression.
Assignment Operators

Unlike many other programming languages, C treats value assignment as operation (represented by an operator) rather than instruction.

Simple Assignment Operator

For a common value assignment, a simple assignment operator (=) is used:

```
expression1=expression2
```

The `expression1` is an object (memory location) to which the value of `expression2` is assigned. Operand `expression1` has to be lvalue and `expression2` can be any expression. The assignment expression itself is not lvalue.

If `expression1` and `expression2` are of different types, the result of the `expression2` will be converted to the type of `expression1`, if necessary. Refer to Type Conversions for more information.

Compound Assignment Operator

C allows more complex assignments by means of compound assignment operators. The syntax of compound assignment operators is:

```
expression1 op = expression2
```

where `op` can be one of binary operators `+`, `-`, `*`, `/`, `%`, `&`, `|`, `^`, `<<`, or `>>`.

Thus, we have 10 different compound assignment operators: `+=`, `-=` , `*=` , `/=` , `%=` , `&=` , `|=` , `^=` , `<<=` and `>>=`. All of them associate from right to left. Spaces separating compound operators (e.g. `+=`) will generate an error.

Compound assignment has the same effect as

```
expression1 = expression1 op expression2
```

except the lvalue `expression1` is evaluated only once. For example, `expression1+= expression2` is the same as `expression1 = expression1 + expression2`. 
Assignment Rules

For both simple and compound assignment, the operands `expression1` and `expression2` must obey one of the following rules:

1. `expression1` is of qualified or unqualified arithmetic type and `expression2` is of arithmetic type.
2. `expression1` has a qualified or unqualified version of structure or union type compatible with the type of `expression2`.
3. `expression1` and `expression2` are pointers to qualified or unqualified versions of compatible types and the type pointed to by left has all qualifiers of the type pointed to by right.
4. Either `expression1` or `expression2` is a pointer to an object or incomplete type and the other is a pointer to a qualified or unqualified version of void. The type pointed to by left has all qualifiers of the type pointed to by right.
5. `expression1` is a pointer and `expression2` is a null pointer constant.

sizeof Operator

The prefix unary operator `sizeof` returns an integer constant that represents the size of memory space (in bytes) used by its operand (determined by its type, with some exceptions).

The operator `sizeof` can take either a type identifier or an unary expression as an operand. You cannot use `sizeof` with expressions of function type, incomplete types, parenthesized names of such types, or with lvalue that designates a bit field object.

sizeof Applied to Expression

If applied to expression, the size of an operand is determined without evaluating the expression (and therefore without side effects). The result of the operation will be the size of the type of the expression’s result.

sizeof Applied to Type

If applied to a type identifier, `sizeof` returns the size of the specified type. The unit for type size is `sizeof(char)` which is equivalent to one byte. The operation `sizeof(char)` gives the result 1, whether `char` is signed or unsigned.

Thus:

```
sizeof(char)          /* returns 1 */
sizeof(int)           /* returns 2 */
sizeof(unsigned long) /* returns 4 */
sizeof(float)         /* returns 4 */
```
When the operand is a non-parameter of array type, the result is the total number of bytes in the array (in other words, an array name is not converted to a pointer type):

```c
int i, j, a[10];
...
j = sizeof(a[1]);  /* j = sizeof(int) = 2 */
i = sizeof(a);     /* i = 10*sizeof(int) = 20 */

/* To get the number of elements in an array: */
int num_elem = i/j;
```

If the operand is a parameter declared as array type or function type, `sizeof` gives the size of the pointer. When applied to structures and unions, `sizeof` gives the total number of bytes, including any padding. The operator `sizeof` cannot be applied to a function.

**EXPRESSION**

Expression is a sequence of operators, operands, and punctuators that specifies a computation. Formally, expressions are defined recursively: subexpressions can be nested without formal limit. However, the compiler will report an out-of-memory error if it can’t compile an expression that is too complex.

In ANSI C, the *primary expressions* are: constant (also referred to as literal), identifier, and *(expression)*, defined recursively.

Expressions are evaluated according to a certain conversion, grouping, associativity and precedence rules, which depends on the operators used, presence of parentheses and data types of the operands. The precedence and associativity of the operators are summarized in Operator Precedence and Associativity. The way operands and subexpressions are grouped does not necessarily specify the actual order in which they are evaluated by the `mikroC PRO for PIC`.

Expressions can produce lvalue, rvalue, or no value. Expressions might cause side effects whether they produce a value or not.

**Comma Expressions**

One of the specifics of C is that it allows using of comma as a sequence operator to form so-called *comma expressions* or *sequences*. Comma expression is a comma-delimited list of expressions – it is formally treated as a single expression so it can be used in places where an expression is expected. The following sequence:

```c
expression_1, expression_2;
```
results in the left-to-right evaluation of each expression, with the value and type of expression_2 giving the result of the whole expression. Result of expression_1 is discarded.

Binary operator comma (,) has the lowest precedence and associates from left to right, so that a, b, c is the same as (a, b), c. This allows writing sequences with any number of expressions:

expression_1, expression_2, ... expression_n;

which results in the left-to-right evaluation of each expression, with the value and type of expression_n giving the result of the whole expression. Results of other expressions are discarded, but their (possible) side-effect do occur.

For example:

```c
result = ( a = 5, b /= 2, c++ );
/* returns preincremented value of variable c,
   but also initializes a, divides b by 2 and increments c */
```

```c
result = ( x = 10, y = x + 3, x--, z -= x * 3 - --y );
/* returns computed value of variable z,
   and also computes x and y */
```

**Note**

Do not confuse comma operator (sequence operator) with comma punctuator which separates elements in a function argument list and initializer lists. To avoid ambiguity with commas in function argument and initializer lists, use parentheses. For example,

```c
func(i, (j = 1, j + 4), k);
```

calls the function `func` with three arguments (i, 5, k), not four.
Statements specify a flow of control as the program executes. In the absence of specific jump and selection statements, statements are executed sequentially in the order of appearance in the source code.

Statements can be roughly divided into:

- Labeled Statements
- Expression Statements
- Selection Statements
- Iteration Statements (Loops)
- Jump Statements
- Compound Statements (Blocks)

**Labeled Statements**

Each statement in a program can be labeled. A label is an identifier added before the statement like this:

```c
label_identifier: statement;
```

There is no special declaration of a label – it just “tags” the statement. `label_identifier` has a function scope and the same label cannot be redefined within the same function.

Labels have their own namespace: label identifier can match any other identifier in the program.

A statement can be labeled for two reasons:

1. The label identifier serves as a target for the unconditional goto statement,
2. The label identifier serves as a target for the switch statement. For this purpose, only `case` and `default` labeled statements are used:

```c
case constant-expression : statement
default : statement
```
**Expression Statements**

Any expression followed by a semicolon forms an expression statement:

```
expression;
```

The *mikroC PRO for PIC* executes an expression statement by evaluating the expression. All side effects from this evaluation are completed before the next statement starts executing. Most of expression statements are assignment statements or function calls.

A null statement is a special case, consisting of a single semicolon (`;`). The null statement does nothing, and therefore is useful in situations where the *mikroC PRO for PIC* syntax expects a statement but the program does not need one. For example, a null statement is commonly used in “empty” loops:

```
for (; *q++ = *p++ ;); /* body of this loop is a null statement */
```

**Selection Statements**

Selection or flow-control statements select one of alternative courses of action by testing certain values. There are two types of selection statements:

- if
- switch

**If Statement**

The if statement is used to implement a conditional statement. The syntax of the if statement is:

```
if (expression) statement1 [ else statement2]
```

If expression evaluates to true, statement1 executes. If statement is false, statement2 executes. The expression must evaluate to an integral value; otherwise, the condition is ill-formed. Parentheses around the expression are mandatory.

The else keyword is optional, but no statements can come between if and else.
Nested If Statement

Nested if statements require additional attention. A general rule is that the nested conditionals are parsed starting from the innermost conditional, with each else bound to the nearest available if on its left:

```c
if (expression1) statement1
else if (expression2)
    if (expression3) statement2
    else statement3 /* this belongs to: if (expression3) */
else statement4 /* this belongs to: if (expression2) */
```

Note

#if and #else preprocessor statements (directives) look similar to if and else statements, but have very different effects. They control which source file lines are compiled and which are ignored.

Switch Statements

The switch statement is used to pass control to a specific program branch, based on a certain condition. The syntax of the switch statement is:

```c
switch (expression) {
    case constant-expression_1 : statement_1;
    .
    .
    .
    case constant-expression_n : statement_n;
    [ default : statement;]
}
```

First, the expression (condition) is evaluated. The switch statement then compares it to all available constant-expressions following the keyword case. If a match is found, switch passes control to that matching case causing the statement following the match evaluates. Note that constant-expressions must evaluate to integer. It is not possible to have two same constant expressions evaluating to the same value.

Parentheses around expression are mandatory.

Upon finding a match, program flow continues normally: the following instructions will be executed in natural order regardless of the possible case label. If no case satisfies the condition, the default case evaluates (if the label default is specified).

For example, if a variable i has value between 1 and 3, the following switch would
always return it as 4:

```c
switch (i) {
    case 1: i++;
    case 2: i++;
    case 3: i++;
}
```

To avoid evaluating any other cases and relinquish control from `switch`, each `case` should be terminated with `break`.

Here is a simple example with `switch`. Suppose we have a variable `phase` with only 3 different states (0, 1, or 2) and a corresponding function (event) for each of these states. This is how we could switch the code to the appropriate routine:

```c
switch (phase) {
    case 0: Lo(); break;
    case 1: Mid(); break;
    case 2: Hi(); break;
    case: Message("Invalid state!");
}
```

### Nested Switch

Conditional `switch` statements can be nested — labels `case` and `default` are then assigned to the innermost enclosing `switch` statement.

### Iteration Statements (Loops)

Iteration statements allows to loop a set of statements. There are three forms of iteration statements in the `mikroC PRO for PIC`:

- while
- do
- for

#### While Statement

The `while` keyword is used to conditionally iterate a statement. The syntax of the `while` statement is:

```c
while (expression) statement
```

The `statement` executes repeatedly until the value of `expression` is false. The test takes place before `statement` is executed. Thus, if `expression` evaluates to false
on the first pass, the loop does not execute. Note that parentheses around expression are mandatory.

Here is an example of calculating scalar product of two vectors, using the while statement:

```c
int s = 0, i = 0;
while (i < n) {
    s += a[i] * b[i];
    i++;
}
```

Note that body of the loop can be a null statement. For example:

```c
while (*q++ = *p++);
```

**Do Statement**

The do statement executes until the condition becomes false. The syntax of the do statement is:

```
do statement while (expression);
```

The statement is executed repeatedly as long as the value of expression remains non-zero. The expression is evaluated after each iteration, so the loop will execute statement at least once.

Parentheses around expression are mandatory.

Note that do is the only control structure in C which explicitly ends with semicolon (;). Other control structures end with statement, which means that they implicitly include a semicolon or closing brace.

Here is an example of calculating scalar product of two vectors, using the do statement:

```c
s = 0; i = 0;
do {
    s += a[i] * b[i];
    i++;
} while (i < n);
```
**For Statement**

The `for` statement implements an iterative loop. The syntax of the `for` statement is:

```c
for ([init-expression]; [condition-expression]; [increment-expression]) statement
```

Before the first iteration of the loop, `init-expression` sets the starting variables for the loop. You cannot pass declarations in `init-expression`.

`condition-expression` is checked before the first entry into the block; `statement` is executed repeatedly until the value of `condition-expression` is false. After each iteration of the loop, `increment-expression` increments a loop counter. Consequently, `i++` is functionally the same as `++i`.

All expressions are optional. If `condition-expression` is left out, it is assumed to be always true. Thus, “empty” `for` statement is commonly used to create an endless loop in C:

```c
for ( ; ; ) statement
```

The only way to break out of this loop is by means of the `break` statement.

Here is an example of calculating scalar product of two vectors, using the `for` statement:

```c
for ( s = 0, i = 0; i < n; i++ ) s += a[i] * b[i];
```

There is another way to do this:

```c
for ( s = 0, i = 0; i < n; s += a[i] * b[i], i++ ); /* valid, but ugly */
```

but it is considered a bad programming style. Although legal, calculating the sum should not be a part of the incrementing expression, because it is not in the service of loop routine. Note that null statement (;) is used for the loop body.
Jump Statements

The jump statement, when executed, transfers control unconditionally. There are four such statements in the *mikroC PRO for PIC*:

- **break**
- **continue**
- **goto**
- **return**

**BREAK AND CONTINUE STATEMENTS**

**Break Statement**

Sometimes it is necessary to stop the loop within its body. Use the `break` statement within loops to pass control to the first statement following the innermost `switch`, `for`, `while`, or `do` block.

`break` is commonly used in the `switch` statements to stop its execution upon the first positive match. For example:

```c
switch (state) {
    case 0: Lo(); break;
    case 1: Mid(); break;
    case 2: Hi(); break;
    default: Message("Invalid state!");
}
```

**Continue Statement**

The `continue` statement within loops is used to “skip the cycle”. It passes control to the end of the innermost enclosing end brace belonging to a looping construct. At that point the loop continuation condition is re-evaluated. This means that `continue` demands the next iteration if the loop continuation condition is true.

Specifically, the `continue` statement within the loop will jump to the marked position as it is shown below:

```c
while (...) {
    ...
    if (val>0) continue;
    ...
    // continue jumps here
}
```
Goto Statement

The `goto` statement is used for unconditional jump to a local label — for more information on labels, refer to Labeled Statements. The syntax of the `goto` statement is:

```
goto label_identifier;
```

This will transfer control to the location of a local label specified by `label_identifier`. The `label_identifier` has to be a name of the label within the same function in which the `goto` statement is. The goto line can come before or after the label.

`goto` is used to break out from any level of nested control structures but it cannot be used to jump into block while skipping that block’s initializations – for example, jumping into loop’s body, etc.

The use of `goto` statement is generally discouraged as practically every algorithm can be realized without it, resulting in legible structured programs. One possible application of the `goto` statement is breaking out from deeply nested control structures:

```
for (...) {
    for (...) {
        ...
        if (disaster) goto Error;
        ...
    }
} ...

Error: /* error handling code */
```

Return Statement

The `return` statement is used to exit from the current function back to the calling routine, optionally returning a value. The syntax is:

```
return [expression] ;
```

This will evaluate `expression` and return the result. Returned value will be automatically converted to the expected function type, if needed. The `expression` is optional; if omitted, the function will return a random value from memory.

**Note:** The statement `return` in functions of the `void` type cannot have `expression` — in fact, the `return` statement can be omitted altogether if it is the last statement in the function body.
Compound Statements (Blocks)

The compound statement, or *block*, is a list (possibly empty) of statements enclosed in matching braces { }. Syntactically, the block can be considered to be a single statement, but it also plays a role in the scoping of identifiers. An identifier declared within the block has a scope starting at the point of declaration and ending at the closing brace. Blocks can be nested to any depth up to the limits of memory.

For example, the *for* loop expects one statement in its body, so we can pass it a compound statement:

```c
for (i = 0; i < n; i++) {
    int temp = a[i];
    a[i] = b[i];
    b[i] = temp;
}
```

Note that, unlike other statements, compound statements do not end with semicolon (;), i.e. there is never a semicolon following the closing brace.

**PREPROCESSOR**

Preprocessor is an integrated text processor which prepares the source code for compiling. Preprocessor allows:

- inserting text from a specified file to a certain point in the code (see File Inclusion),
- replacing specific lexical symbols with other symbols (see Macros),
- conditional compiling which conditionally includes or omits parts of the code (see Conditional Compilation).

Note that preprocessor analyzes text at token level, not at individual character level. Preprocessor is controlled by means of preprocessor directives and preprocessor operators.

**Preprocessor Directives**

Any line in the source code with a leading # is taken as a *preprocessing directive* (or *control line*), unless # is within a string literal, in a character constant, or embedded in a comment. The initial # can be preceded or followed by a whitespace (excluding new lines).

A *null directive* consists of a line containing the single character #. This line is always ignored.

Preprocessor directives are usually placed at the beginning of the source code, but
they can legally appear at any point in a program. The *mikroC PRO for PIC* preprocessor detects preprocessor directives and parses the tokens embedded in them. A directive is in effect from its declaration to the end of the program file.

Here is one commonly used directive:

```c
#include <math.h>
```

For more information on including files with the `#include` directive, refer to File Inclusion.

The *mikroC PRO for PIC* supports standard preprocessor directives:

```c
#define  
#endif  
#define    
#else    
#endif    
#error    
#undef
```

**Note:** For the time being only funcall pragma is supported.

**Line Continuation with Backslash (\)**

To break directive into multiple lines end the line with a backslash (\):

```c
#define MACRO  This directive continues to \ 
  the following line.
```
Macros

Macros provide a mechanism for a token replacement, prior to compilation, with or without a set of formal, function-like parameters.

Defining Macros and Macro Expansions

The `#define` directive defines a macro:

```c
#define macro_identifier <token_sequence>
```

Each occurrence of `macro_identifier` in the source code following this control line will be replaced in the original position with the possibly empty `token_sequence` (there are some exceptions, which are discussed later). Such replacements are known as macro expansions. `token_sequence` is sometimes called the body of a macro. An empty token sequence results in the removal of each affected macro identifier from the source code.

No semicolon (;) is needed to terminate a preprocessor directive. Any character found in the token sequence, including semicolons, will appear in a macro expansion. `token_sequence` terminates at the first non-backslashed new line encountered. Any sequence of whitespace, including comments in the token sequence, is replaced with a single-space character.

After each individual macro expansion, a further scan is made of the newly expanded text. This allows the possibility of using nested macros: the expanded text can contain macro identifiers that are subject to replacement. However, if the macro expands into something that looks like a preprocessing directive, such directive will not be recognized by the preprocessor. Any occurrences of the macro identifier found within literal strings, character constants, or comments in the source code will not be expanded.

A macro won’t be expanded during its own expansion (so `#define MACRO MACRO` won’t expand indefinitely).

Here is an example:

```c
/* Here are some simple macros: */
#define ERR_MSG "Out of range!"
#define EVERLOOP for( ; ; )
/* which we could use like this: */
main() {
    EVERLOOP {
        ... 
        if (error) { Lcd_Out_Cp(ERR_MSG); break; }
        ...
    }
    ...
}
```
Attempting to redefine an already defined macro identifier will result in a warning unless a new definition is exactly the same token-by-token definition as the existing one. The preferred strategy when definitions might exist in other header files is as follows:

```c
#ifndef BLOCK_SIZE
    #define BLOCK_SIZE 512
#endif
```

The middle line is bypassed if `BLOCK_SIZE` is currently defined; if `BLOCK_SIZE` is not currently defined, the middle line is invoked to define it.

### Macros with Parameters

The following syntax is used to define a macro with parameters:

```c
#define macro_identifier(<arg_list>) <token_sequence>
```

Note that there can be no whitespace between `macro_identifier` and "(". The optional `arg_list` is a sequence of identifiers separated by commas, like the argument list of a C function. Each comma-delimited identifier has the role of a formal argument or placeholder.

Such macros are called by writing

```c
macro_identifier(<actual_arg_list>)
```

in the subsequent source code. The syntax is identical to that of a function call; indeed, many standard library C “functions” are implemented as macros. However, there are some important semantic differences.

The optional `actual_arg_list` must contain the same number of comma-delimited token sequences, known as actual arguments, as found in the formal `arg_list` of the `#define` line – there must be an actual argument for each formal argument. An error will be reported if the number of arguments in two lists is not the same.

A macro call results in two sets of replacements. First, the macro identifier and the parenthesis-enclosed arguments are replaced by the token sequence. Next, any formal arguments occurring in the token sequence are replaced by the corresponding real arguments appearing in `actual_arg_list`. Like with simple macro definitions, rescanning occurs to detect any embedded macro identifiers eligible for expansion.

Here is a simple example:

```c
/* A simple macro which returns greater of its 2 arguments: */
```
#define _MAX(A, B) ((A) > (B)) ? (A) : (B)

/* Let's call it: */
x = _MAX(a + b, c + d);

/* Preprocessor will transform the previous line into:
x = ((a + b) > (c + d)) ? (a + b) : (c + d) */

It is highly recommended to put parentheses around each argument in the macro body in order to avoid possible problems with operator precedence.

**Undeﬁning Macros**

The `#undef` directive is used to undeﬁne a macro.

```c
#undef macro_identifier
```

The directive `#undef` detaches any previous token sequence from `macro_identifier`; the macro deﬁnition has been forgotten, and `macro_identifier` is undeﬁned. No macro expansion occurs within the `#undef` lines.

The state of being deﬁned or undeﬁned is an important property of an identiﬁer, regardless of the actual deﬁnition. The `#ifdef` and `#ifndef` conditional directives, used to test whether any identiﬁer is currently deﬁned or not, offer a ﬂexible mechanism for controlling many aspects of a compilation.

After a macro identiﬁer has been undeﬁned, it can be redeﬁned with `#define`, using the same or different token sequence.

**File Inclusion**

The preprocessor deﬁnitive `#include` pulls in header ﬁles (extension `.h`) into the source code. Do not rely on preprocessor to include source ﬁles (extension `.`) — see Add/Remove Files from Project for more information.

The syntax of the `#include` deﬁnitive has two formats:

```c
#include <header_name>
#include "header_name"
```

The preprocessor removes the `#include` line and replaces it with the entire text of a header ﬁle at that point in the source code. The placement of `#include` can there-fore inﬂuence the scope and duration of any identiﬁers in the included ﬁle.

The difference between these two formats lies in searching algorithm employed in
trying to locate the include file.

If the `#include` directive is used with the `<header_name>` version, the search is made successively in each of the following locations, in this particular order:

1. the mikroC PRO for PIC installation folder › “include” folder
2. user’s custom search paths

The "header_name" version specifies a user-supplied include file; the mikroC PRO for PIC will look for the header file in the following locations, in this particular order:

1. the project folder (folder which contains the project file `.mcppi`)
2. the mikroC PRO for PIC installation folder › “include” folder
3. user's custom search paths

Explicit Path

By placing an explicit path in `header_name`, only that directory will be searched. For example:

`#include "C:\my_files\test.h"`

Note

There is also a third version of the `#include` directive, rarely used, which assumes that neither `<` nor `"` appear as the first non-whitespace character following `#include`:

`#include macro_identifier`

It assumes that macro definition that will expand `macro identifier` into a valid delimited header name with either `<header_name>` or "header_name" formats exists.
Preprocessor Operators

The # (pound sign) is a preprocessor directive when it occurs as the first non-whitespace character on a line. Also, # and ## perform operator replacement and merging during the preprocessor scanning phase.

Operator #

In C preprocessor, a character sequence enclosed by quotes is considered a token and its content is not analyzed. This means that macro names within quotes are not expanded.

If you need an actual argument (the exact sequence of characters within quotes) as a result of preprocessing, use the # operator in macro body. It can be placed in front of a formal macro argument in definition in order to convert the actual argument to a string after replacement.

For example, let's have macro LCD_PRINT for printing variable name and value on Lcd:

```c
#define LCD_PRINT(val) Lcd_Custom_Out_Cp(#val " "); Lcd_Custom_Out_Cp(IntToStr(val));
```

Now, the following code,

```c
LCD_PRINT(temp)
```

will be preprocessed to this:

```c
Lcd_Custom_Out_Cp("temp " "); Lcd_Custom_Out_Cp(IntToStr(temp));
```

Operator ##

Operator ## is used for token pasting. Two tokens can be pasted(merged) together by placing ## in between them (plus optional whitespace on either side). The preprocessor removes whitespace and ##, combining the separate tokens into one new token. This is commonly used for constructing identifiers.

For example, see the definition of macro SPLICE for pasting two tokens into one identifier:

```c
#define SPLICE(x,y) x ## _ ## y
```

Now, the call SPLICE(cnt,2) will expand to the identifier cnt_2.
Note

The *mikroC PRO for PIC* does not support the older nonportable method of token pasting using `#l/*/*r`.

Conditional Compilation

Conditional compilation directives are typically used to make source programs easy to change and easy to compile in different execution environments. The mikroC PRO for PIC supports conditional compilation by replacing the appropriate source-code lines with a blank line.

All conditional compilation directives must be completed in the source or include file in which they have begun.

Directives #if, #elif, #else and #endif

The conditional directives `#if`, `#elif`, `#else`, and `#endif` work very similar to the common C conditional statements. If the expression you write after `#if` has a nonzero value, the line group immediately following the `#if` directive is retained in the translation unit.

The syntax is:

```c
#if constant_expression_1
 <section_1>
[ #elif constant_expression_2
 <section_2>
] ...
[ #elif constant_expression_n
 <section_n>
] [
 #else
 <final_section>
] #endif
```

Each `#if` directive in a source file must be matched by a closing `#endif` directive. Any number of `#elif` directives can appear between `#if` and `#endif` directives, but at most one `#else` directive is allowed. The `#else` directive, if present, must be the last directive before `#endif`.

`sections` can be any program text that has meaning to compiler or preprocessor. The preprocessor selects a single section by evaluating `constant_expression` fol-
lowing each #if or #elif directive until it finds a true (nonzero) constant expression. The constant expressions are subject to macro expansion.

If all occurrences of constant-expression are false, or if no #elif directives appear, the preprocessor selects the text block after the #else clause. If the #else clause is omitted and all instances of constant_expression in the #if block are false, no section is selected for further processing.

Any processed section can contain further conditional clauses, nested to any depth. Each nested #else, #elif, or #endif directive belongs to the closest preceding the #if directive.

The net result of the preceding scenario is that only one code section (possibly empty) will be compiled.

**Directives #ifdef and #ifndef**

The #ifdef and #ifndef directives can be used anywhere #if can be used and they can test whether an identifier is currently defined or not. The line

```
#ifdef identifier
```

has exactly the same effect as #if 1 if identifier is currently defined, and the same effect as #if 0 if identifier is currently undefined. The other directive, #ifndef, tests true for the “not-defined” condition, producing the opposite results.

The syntax thereafter follows that of #if, #elif, #else, and #endif.

An identifier defined as NULL is considered to be defined.
mikroC PRO for PIC Libraries

*mikroC PRO for PIC* provides a set of libraries which simplify the initialization and use of PIC compliant MCUs and their modules:

Use Library manager to include *mikroC PRO for PIC Libraries* in your project.
Hardware PIC-specific Libraries

- ADC Library
- CAN Library
- CANSPI Library
- Compact Flash Library
- EEPROM Library
- Ethernet PIC18FxxJ60 Library
- Flash Memory Library
- Graphic LCD Library
- I²C Library
- Keypad Library
- LCD Library
- Manchester Code Library
- MultiMedia Card Library
- OneWire Library
- Port Expander Library
- PrintOut Library
- PS/2 Library
- PWM Library
- RS-485 Library
- Software I²C Library
- Software SPI Library
- Software UART Library
- Sound Library
- SPI Library
- SPI Ethernet Library
- SPI Graphic LCD Library
- SPI LCD Library
- SPI LCD8 Library
- SPI T6963C Graphic LCD Library
- T6963C Graphic LCD Library
- UART Library
- USB HID Library

Standard ANSI C Libraries

- ANSI C Ctypes Library
- ANSI C Math Library
- ANSI C Stdlib Library
- ANSI C String Library

Miscellaneous Libraries

- Button Library
- Conversions Library
- Sprint Library
- Setjmp Library
- Time Library
- Trigonometry Library

See also Built-in Routines.
Certain libraries use (depend on) function and/or variables, constants defined in other libraries. Image below shows clear representation about these dependencies.

For example, SPI_Glcd uses Glcd_Fonts and Port_Expander library which uses SPI library. This means that if you check SPI_Glcd library in Library manager, all libraries on which it depends will be checked too.

ADC LIBRARY

ADC (Analog to Digital Converter) module is available with a number of PIC MCU models. Library function `ADC_Read` is included to provide you comfortable work with the module.

ADC_Read

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned ADC_Read(unsigned short channel);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>10-bit unsigned value read from the specified channel.</td>
</tr>
<tr>
<td>Description</td>
<td>Initializes PIC's internal ADC module to work with RC clock. Clock determines the time period necessary for performing AD conversion (min 12TAD). Parameter <code>channel</code> represents the channel from which the analog value is to be acquired. Refer to the appropriate datasheet for channel-to-pin mapping.</td>
</tr>
<tr>
<td>Requires</td>
<td>Nothing.</td>
</tr>
</tbody>
</table>
| Example         | `unsigned tmp;`  
|                 | `...`  
|                 | `tmp = ADC_Read(2); // Read analog value from channel 2` |

Library Example

This example code reads analog value from channel 2 and displays it on PORTB and PORTC.

```c
unsigned int temp_res;

void main() {
    ANSEL = 0x04;           // Configure AN2 pin as analog
    TRISA = 0xFF;           // PORTA is input
    ANSELH = 0;             // Configure other AN pins as digital I/O
    TRISC = 0x3F;           // Pins RC7, RC6 are outputs
    TRISB = 0;              // PORTB is output

    do {
        temp_res = ADC_Read(2);  // Get 10-bit results of AD conversion
        PORTB = temp_res;         // Send lower 8 bits to PORTB
        PORTC = temp_res >> 2;    // Send 2 most significant bits to RC7, RC6
    } while(1);
}
```
ADC HW connection

**CAN LIBRARY**

*micróC PRO for PIC* provides a library (driver) for working with the CAN module.

CAN is a very robust protocol that has error detection and signalling, self–checking and fault confinement. Faulty CAN data and remote frames are re-transmitted automatically, similar to the Ethernet.

Data transfer rates vary from up to 1 Mbit/s at network lengths below 40m to 250 Kbit/s at 250m cables, and can go even lower at greater network distances, down to 200Kbit/s, which is the minimum bitrate defined by the standard. Cables used are shielded twisted pairs, and maximum cable length is 1000m.

CAN supports two message formats:

- Standard format, with 11 identifier bits, and
- Extended format, with 29 identifier bits

**Note:** CAN Library is supported only by MCUs with the CAN module.

**Note:** Consult the CAN standard about CAN bus termination resistance.
Library Routines

- CANSetOperationMode
- CANGetOperationMode
- CANInitialize
- CANSetBaudRate
- CANSetMask
- CANSetFilter
- CANRead
- CANWrite

Following routines are for the internal use by compiler only:

- RegsToCANID
- CANIDToRegs

Be sure to check CAN constants necessary for using some of the functions.

**CANSetOperationMode**

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void CANSetOperationMode(unsigned short mode, unsigned short wait_flag);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Sets CAN to requested mode, i.e. copies mode to CANSTAT. Parameter mode needs to be one of CAN_OP_MODE constants (see CAN constants).</td>
</tr>
<tr>
<td></td>
<td>Parameter wait_flag needs to be either 0 or 0xFF:</td>
</tr>
<tr>
<td></td>
<td>- If set to 0xFF, this is a blocking call – the function won’t “return” until the requested mode is set.</td>
</tr>
<tr>
<td></td>
<td>- If 0, this is a non-blocking call. It does not verify if CAN module is switched to requested mode or not. Caller must use CANGetOperationMode to verify correct operation mode before performing mode specific operation.</td>
</tr>
<tr>
<td>Requires</td>
<td>CAN routines are currently supported only by P18XXX8 PIC MCUs. Microcontroller must be connected to CAN transceiver (MCP2551 or similar) which is connected to CAN bus.</td>
</tr>
<tr>
<td>Example</td>
<td>CANSetOperationMode(_CAN_MODE_CONFIG, 0xFF);</td>
</tr>
</tbody>
</table>
### CANGetOperationMode

**Prototype**

```c
unsigned short CANGetOperationMode();
```

**Returns**

Current opmode.

**Description**

Function returns current operational mode of CAN module.

**Requires**

CAN routines are currently supported only by P18XXX8 PIC MCUs. Microcontroller must be connected to CAN transceiver (MCP2551 or similar) which is connected to CAN bus.

**Example**

```c
if (CANGetOperationMode() == _CAN_MODE_NORMAL) { ... };
```

### CANInitialize

**Prototype**

```c
void CANInitialize(char SJW, char BRP, char PHSEG1, char PHSEG2, char PROPSEG, char CAN_CONFIG_FLAGS);
```

**Returns**

Nothing.

**Description**

Initializes CAN. All pending transmissions are aborted. Sets all mask registers to 0 to allow all messages. The Config mode is internally set by this function. Upon a execution of this function Normal mode is set. Filter registers are set according to flag value:

```c
if (CAN_CONFIG_FLAGS & _CAN_CONFIG_VALID_XTD_MSG != 0)
    // Set all filters to XTD_MSG
else if (config & _CAN_CONFIG_VALID_STD_MSG != 0)
    // Set all filters to STD_MSG
else
    // Set half the filters to STD, and the rest to XTD_MSG
```

**Parameters:**

- **SJW** as defined in 18XXX8 datasheet (1–4)
- **BRP** as defined in 18XXX8 datasheet (1–64)
- **PHSEG1** as defined in 18XXX8 datasheet (1–8)
- **PHSEG2** as defined in 18XXX8 datasheet (1–8)
- **PROPSEG** as defined in 18XXX8 datasheet (1–8)
- **CAN_CONFIG_FLAGS** is formed from predefined constants (see CAN constants)

**Requires**

CAN routines are currently supported only by P18XXX8 PIC MCUs. Microcontroller must be connected to CAN transceiver (MCP2551 or similar) which is connected to CAN bus.

**Example**

```c
init = _CAN_CONFIG_SAMPLE_THRICE &
      _CAN_CONFIG_PHSEG2_PRG_ON &
      _CAN_CONFIG_STD_MSG &
      _CAN_CONFIG_DBL_BUFFER_ON &
      _CAN_CONFIG_VALID_XTD_MSG &
      _CAN_CONFIG_LINE_FILTER_OFF;
...
CANInitialize(1, 1, 3, 3, 1, init);  // initialize CAN
```
### CANSetBaudRate

#### Prototype

```c
void CANSetBaudRate(char SJW, char BRP, char PHSEG1, char PHSEG2, char PROPSEG, char CAN_CONFIG_FLAGS);
```

#### Returns

Nothing.

#### Description

Sets CAN baud rate. Due to complexity of CAN protocol, you cannot simply force a bps value. Instead, use this function when CAN is in Config mode. Refer to datasheet for details.

Parameters:
- **SJW** as defined in 18XXX8 datasheet (1–4)
- **BRP** as defined in 18XXX8 datasheet (1–64)
- **PHSEG1** as defined in 18XXX8 datasheet (1–8)
- **PHSEG2** as defined in 18XXX8 datasheet (1–8)
- **PROPSEG** as defined in 18XXX8 datasheet (1–8)
- **CAN_CONFIG_FLAGS** is formed from predefined constants (see CAN constants)

#### Requires

CAN must be in Config mode; otherwise the function will be ignored. CAN routines are currently supported only by P18XXX8 PIC MCUs. Microcontroller must be connected to CAN transceiver (MCP2551 or similar) which is connected to CAN bus.

#### Example

```c
init = _CAN_CONFIG_SAMPLE_THRICE &
      _CAN_CONFIG_PHSEG2_PRG_ON &
      _CAN_CONFIG_STD_MSG &
      _CAN_CONFIG_DBL_BUFFER_ON &
      _CAN_CONFIG_VALID_XTD_MSG &
      _CAN_CONFIG_LINE_FILTER_OFF;

...  
CANSetBaudRate(1, 1, 3, 3, 1, init);
```
**CANSetMask**

**Prototype**

```c
void CANSetFilter(char CAN_FILTER, long value, char CAN_CONFIG_FLAGS);
```

**Returns**

Nothing.

**Description**

Function sets mask for advanced filtering of messages. Given `value` is bit adjusted to appropriate buffer mask registers.

Parameters:

- `CAN_MASK` is one of predefined constant values (see CAN constants)
- `value` is the mask register value
- `CAN_CONFIG_FLAGS` selects type of message to filter, either
  - `_CAN_CONFIG_XTD_MSG` or `_CAN_CONFIG_STD_MSG`

**Requires**

 CAN must be in Config mode; otherwise the function will be ignored.
CAN routines are currently supported only by P18XXX8 PIC MCUs. Microcontroller must be connected to CAN transceiver (MCP2551 or similar) which is connected to CAN bus.

**Example**

```c
// Set all mask bits to 1, i.e. all filtered bits are relevant:
CANSetMask(_CAN_MASK_B1, -1, _CAN_CONFIG_XTD_MSG);
// Note that -1 is just a cheaper way to write 0xFFFFFFFF.
// Complement will do the trick and fill it up with ones.
```

**CANSetFilter**

**Prototype**

```c
void CANSetFilter(char CAN_FILTER, long value, char CAN_CONFIG_FLAGS);
```

**Returns**

Nothing.

**Description**

Function sets message filter. Given `value` is bit adjusted to appropriate buffer mask registers.

Parameters:

- `CAN_FILTER` is one of predefined constant values (see CAN constants)
- `value` is the filter register value
- `CAN_CONFIG_FLAGS` selects type of message to filter, either
  - `_CAN_CONFIG_XTD_MSG` or `_CAN_CONFIG_STD_MSG`

**Requires**

 CAN must be in Config mode; otherwise the function will be ignored.
CAN routines are currently supported only by P18XXX8 PIC MCUs. Microcontroller must be connected to CAN transceiver (MCP2551 or similar) which is connected to CAN bus.

**Example**

```c
// Set id of filter B1_F1 to 3:
CANSetFilter(_CAN_FILTER_B1_F1, 3, _CAN_CONFIG_XTD_MSG);
```
### CANRead

**Prototype**

```c
char CANRead(long *id, char *data, char *datalen, char *CAN_RX_MSG_FLAGS);
```

**Returns**

Message from receive buffer or zero if no message found.

**Description**

- `id` is message identifier
- `data` is an array of bytes up to 8 bytes in length
- `datalen` is data length, from 1–8.
- `CAN_RX_MSG_FLAGS` is value formed from constants (see CAN constants)

**Requires**

CAN must be in mode in which receiving is possible.

CAN routines are currently supported only by P18XXX8 PIC MCUs. Microcontroller must be connected to CAN transceiver (MCP2551 or similar) which is connected to CAN bus.

**Example**

```c
char rcv, rx, len, data[8];
long id;
// ...
rx = 0;
// ...
rcv = CANRead(id, data, len, rx);
```

### CANWrite

**Prototype**

```c
unsigned short CANWrite(long id, char *data, char datailen, char CAN_TX_MSG_FLAGS);
```

**Returns**

Returns zero if message cannot be queued (buffer full).

**Description**

If at least one empty transmit buffer is found, function sends message on queue for transmission. If buffer is full, function returns 0.

Parameters:

- `id` is CAN message identifier. Only 11 or 29 bits may be used depending on message type (standard or extended)
- `data` is array of bytes up to 8 bytes in length
- `datalen` is data length from 1–8
- `CAN_TX_MSG_FLAGS` is value formed from constants (see CAN constants)

**Requires**

CAN must be in Normal mode.

CAN routines are currently supported only by P18XXX8 PIC MCUs. Microcontroller must be connected to CAN transceiver (MCP2551 or similar) which is connected to CAN bus.

**Example**

```c
char tx, data;
long id;
// ...
tx = _CAN_TX_PRIORITY_0 &
    _CAN_TX_XTD_FRAME;
// ...
CANWrite(id, data, 2, tx);
```
CAN Constants

There is a number of constants predefined in CAN library. To be able to use the library effectively, you need to be familiar with these. You might want to check the example at the end of the chapter.

CAN_OP_MODE

CAN_OP_MODE constants define CAN operation mode. Function CANSetOperationMode expects one of these as its argument:

```c
const char
  _CAN_MODE_BITS   = 0xE0,   // Use this to access opmode bits
  _CAN_MODE_NORMAL = 0x00,
  _CAN_MODE_SLEEP  = 0x20,
  _CAN_MODE_LOOP   = 0x40,
  _CAN_MODE_LISTEN = 0x60,
  _CAN_MODE_CONFIG = 0x80;
```

CAN_CONFIG_FLAGS

CAN_CONFIG_FLAGS constants define flags related to CAN module configuration. Functions CANInitialize and CANSetBaudRate expect one of these (or a bitwise combination) as their argument:

```c
const char
  _CAN_CONFIG_DEFAULT         = 0xFF,   // 11111111
  _CAN_CONFIG_PHSEG2_PRG_BIT  = 0x01,
  _CAN_CONFIG_PHSEG2_PRG_ON   = 0xFF,   // XXXXXXX1
  _CAN_CONFIG_PHSEG2_PRG_OFF  = 0xFE,   // XXXXXXX0
  _CAN_CONFIG_LINE_FILTER_BIT = 0x02,
  _CAN_CONFIG_LINE_FILTER_ON  = 0xFF,   // XXXXXX1X
  _CAN_CONFIG_LINE_FILTER_OFF = 0xFD,   // XXXXXX0X
  _CAN_CONFIG_SAMPLE_BIT      = 0x04,
  _CAN_CONFIG_SAMPLE_ONCE     = 0xFF,   // XXXXX1XX
  _CAN_CONFIG_SAMPLE_THRICE   = 0xFB,   // XXXXX0XX
  _CAN_CONFIG_MSG_TYPE_BIT    = 0x08,
  _CAN_CONFIG_STD_MSG         = 0xFF,   // XXXX1XXX
  _CAN_CONFIG_XTD_MSG         = 0xF7,   // XXXX0XXX
  _CAN_CONFIG_DBL_BUFFER_BIT  = 0x10,
  _CAN_CONFIG_DBL_BUFFER_ON   = 0xFF,   // XXX1XXXX
  _CAN_CONFIG_DBL_BUFFER_OFF  = 0xEF,   // XXX0XXXX
```
_CAN_CONFIG_MSG_BITS = 0x60,
_CAN_CONFIG_ALL_MSG = 0xFF, // X11XXXXX
_CAN_CONFIG_VALID_XTD_MSG = 0xDF, // X10XXXXX
_CAN_CONFIG_VALID_STD_MSG = 0xBF, // X01XXXXX
_CAN_CONFIG_ALL_VALID_MSG = 0x9F; // X00XXXXX

You may use bitwise AND (&) to form config byte out of these values. For example:

```c
init = _CAN_CONFIG_SAMPLE_THRICE &
    _CAN_CONFIG_PHSEG2_PRG_ON &
    _CAN_CONFIG_STD_MSG &
    _CAN_CONFIG_DBL_BUFFER_ON &
    _CAN_CONFIG_VALID_XTD_MSG &
    _CAN_CONFIG_LINE_FILTER_OFF;
```

CANInitialize(1, 1, 3, 3, 1, init); // initialize CAN

**CAN_TX_MSG_FLAGS**

CAN_TX_MSG_FLAGS are flags related to transmission of a CAN message:

```c
class char
_CAN_TX_PRIORITY_BITS = 0x03,
_CAN_TX_PRIORITY_0 = 0xFC, // XXXXXX00
_CAN_TX_PRIORITY_1 = 0xFD, // XXXXXX01
_CAN_TX_PRIORITY_2 = 0xFE, // XXXXXX10
_CAN_TX_PRIORITY_3 = 0xFF, // XXXXXX11
_CAN_TX_FRAME_BIT = 0x08,
_CAN_TX_STD_FRAME = 0xFF, // XXXXX1XX
_CAN_TX_XTD_FRAME = 0xF7, // XXXXX0XX
_CAN_TX_RTR_BIT = 0x40,
_CAN_TX_NO_RTR_FRAME = 0xFF, // X1XXXXXX
_CAN_TX_RTR_FRAME = 0xBF; // X0XXXXXX
```

You may use bitwise AND (&) to adjust the appropriate flags. For example:

```c
// form value to be used with CANSendMessage:
send_config = _CAN_TX_PRIORITY_0 &
    _CAN_TX_XTD_FRAME &
    _CAN_TX_NO_RTR_FRAME;
```

```c
... CANSendMessage(id, data, 1, send_config);
```
**CAN_RX_MSG_FLAGS**

*CAN_RX_MSG_FLAGS* are flags related to reception of CAN message. If a particular bit is set; corresponding meaning is TRUE or else it will be FALSE.

```c
const char _CAN_RX_FILTER_BITS  = 0x07,  // Use this to access filter bits
    _CAN_RX_FILTER_1     = 0x00,
    _CAN_RX_FILTER_2     = 0x01,
    _CAN_RX_FILTER_3     = 0x02,
    _CAN_RX_FILTER_4     = 0x03,
    _CAN_RX_FILTER_5     = 0x04,
    _CAN_RX_FILTER_6     = 0x05,
    _CAN_RX_OVERFLOW     = 0x08,  // Set if Overflowed else cleared
    _CAN_RX_INVALID_MSG  = 0x10,  // Set if invalid else cleared
    _CAN_RX_XTD_FRAME    = 0x20,  // Set if XTD message else cleared
    _CAN_RX_RTR_FRAME    = 0x40,  // Set if RTR message else cleared
    _CAN_RX_DBL_BUFFERED = 0x80;  // Set if this message was hard
                                 // ware double-buffered
```

You may use bitwise AND (\&) to adjust the appropriate flags. For example:

```c
if (MsgFlag & _CAN_RX_OVERFLOW != 0) {
    ...
    // Receiver overflow has occurred.
    // We have lost our previous message.
}
```

**CAN_MASK**

*CAN_MASK* constants define mask codes. Function CANSetMask expects one of these as its argument:

```c
#const char
    _CAN_MASK_B1 = 0,
    _CAN_MASK_B2 = 1;
```

**CAN_FILTER**

*CAN_FILTER* constants define filter codes. Function CANSetFilter expects one of these as its argument:

```c
const char
    _CAN_FILTER_B1_F1 = 0,
    _CAN_FILTER_B1_F2 = 1,
    _CAN_FILTER_B2_F1 = 2,
    _CAN_FILTER_B2_F2 = 3,
```
Library Example

This is a simple demonstration of CAN Library routines usage. First node initiates the communication with the second node by sending some data to its address. The second node responds by sending back the data incremented by 1. First node then does the same and sends incremented data back to second node, etc.

Code for the first CAN node:

```c
unsigned char Can_Init_Flags, Can_Send_Flags, Can_Rcv_Flags; // can flags
unsigned char Rx_Data_Len; // received data length in bytes
char RxTx_Data[8]; // can rx/tx data buffer
char Msg_Rcvd; // reception flag
const long ID_1st = 12111, ID_2nd = 3; // node IDs
long Rx_ID;

void main() {
    PORTC = 0; // clear PORTC
    TRISC = 0; // set PORTC as output

    Can_Init_Flags = 0; // clear flags
    Can_Send_Flags = 0;
    Can_Rcv_Flags  = 0;

    Can_Send_Flags = _CAN_TX_PRIORITY_0 & // form value to be used
                       _CAN_TX_XTD_FRAME & // with CANWrite
                       _CAN_TX_NO_RTR_FRAME;

    Can_Init_Flags = _CAN_CONFIG_SAMPLE_THRICE & // form value to be used
                       _CAN_CONFIG_PHSEG2_PRG_ON & // with CANInit
                       _CAN_CONFIG_XTD_MSG &
                       _CAN_CONFIG_DBL_BUFFER_ON &
                       _CAN_CONFIG_VALID_XTD_MSG;

    CANInitialize(1,3,3,3,1,Can_Init_Flags); // Initialize CAN module
    CANSetOperationMode(_CAN_MODE_CONFIG,0xFF); // set CONFIGURATION mode
    CANSetMask(_CAN_MASK_B1,-1,_CAN_CONFIG_XTD_MSG); // set all mask1 bits to ones
    CANSetMask(_CAN_MASK_B2,-1,_CAN_CONFIG_XTD_MSG); // set all mask2 bits to ones
    CANSetFilter(_CAN_FILTER_B2_F4,ID_2nd,_CAN_CONFIG_XTD_MSG); // set id of filter B2_F4 to 2nd node ID

    CANSetOperationMode(_CAN_MODE_NORMAL,0xFF); // set NORMAL mode
    RxTx_Data[0] = 9; // set initial data to be sent
```
CANWrite(ID_1st, RxTx_Data, 1, Can_Send_Flags); // send initial message

while(1) { // endless loop
    Msg_Rcvd = CANRead(&Rx_ID , RxTx_Data , &Rx_Data_Len, &Can_Rcv_Flags); // receive message
    if ((Rx_ID == ID_2nd) && Msg_Rcvd) { // if message received check id
        PORTC = RxTx_Data[0];  // id correct, output data at PORTC
        RxTx_Data[0]++;       // increment received data
        Delay_ms(10);
        CANWrite(ID_1st, RxTx_Data, 1, Can_Send_Flags); // send incremented data back
    }
}

Code for the second CAN node:

unsigned char Can_Init_Flags, Can_Send_Flags, Can_Rcv_Flags; // can flags
unsigned char Rx_Data_Len;    // received data length in bytes
char RxTx_Data[8];              // can rx/tx data buffer
char Msg_Rcvd;                  // reception flag
const long ID_1st = 12111, ID_2nd = 3;  // node IDs
long Rx_ID;

void main() {

    PORTC = 0;                    // clear PORTC
    TRISC = 0;                    // set PORTC as output

    Can_Init_Flags = 0;            //
    Can_Send_Flags = 0;            // clear flags
    Can_Rcv_Flags  = 0;            //

    Can_Send_Flags = _CAN_TX_PRIORITY_0 & // form value to be used
                     _CAN_TX_XTD_FRAME & // with CANWrite
                     _CAN_TX_NO_RTR_FRAME;

    Can_Init_Flags = _CAN_CONFIG_SAMPLE_THRICE & // form value to be used
                     _CAN_CONFIG_PHSEG2_PRG_ON & // with CANInit
                     _CAN_CONFIG_XTD_MSG &
                     _CAN_CONFIG_DBL_BUFFER_ON &
                     _CAN_CONFIG_VALID_XTD_MSG &
                     _CAN_CONFIG_LINE_FILTER_OFF;

    CANInitialize(1,3,3,3,1,Can_Init_Flags); // initialize external CAN module
    CANSetOperationMode( CAN_MODE_CONFIG,0xFF); // set CONFIGURATION mode
    CANSetMask(_CAN_MASK_B1,-1,_CAN_CONFIG_XTD_MSG); // set all mask1
    bits to ones
CANSetMask(_CAN_MASK_B2,-1,_CAN_CONFIG_XTD_MSG); // set all mask2 bits to ones
CANSetFilter(_CAN_FILTER_B2_F3,ID_1st,_CAN_CONFIG_XTD_MSG); // set id of filter B2_F3 to 1st node ID
CANSetOperationMode(_CAN_MODE_NORMAL,0xFF); // set NORMAL mode

while (1) { // endless loop
    Msg_Rcvd = CANRead(&Rx_ID , RxTx_Data , &Rx_Data.Len, &Can_Rcv_Flags); // receive message
    if ((Rx_ID == ID_1st) && Msg_Rcvd) { // if message received check id
        PORTC = RxTx_Data[0]; // id correct, output data at PORTC
        RxTx_Data[0]++; // increment received data
        CANWrite(ID_2nd, RxTx_Data, 1, Can_Send_Flags); // send incremented data back
    }
}

HW Connection

Example of interfacing CAN transceiver with MCU and bus
**CANSPI LIBRARY**

The SPI module is available with a number of the PIC compliant MCUs. The mikroC PRO for PIC provides a library (driver) for working with mikroElektronika’s CANSPI Add-on boards (with MCP2515 or MCP2510) via SPI interface.

The CAN is a very robust protocol that has error detection and signalization, self–checking and fault confinement. Faulty CAN data and remote frames are re-transmitted automatically, similar to the Ethernet.

Data transfer rates depend on distance. For example, 1 Mbit/s can be achieved at network lengths below 40m while 250 Kbit/s can be achieved at network lengths below 250m. The greater distance the lower maximum bitrate that can be achieved. The lowest bitrate defined by the standard is 200Kbit/s. Cables used are shielded twisted pairs.

CAN supports two message formats:

- Standard format, with 11 identifier bits; and
- Extended format, with 29 identifier bits.

**Note:**

- Consult the CAN standard about CAN bus termination resistance.
- An effective CANSPI communication speed depends on SPI and certainly is slower than “real” CAN.
- The library uses the SPI module for communication. User must initialize SPI module before using the SPI Graphic Lcd Library.
  
  For MCUs with two SPI modules it is possible to initialize both of them and then switch by using the `SPI_Set_Active()` routine.
- CANSPI module refers to mikroElektronika’s CANSPI Add-on board connected to SPI module of MCU.

**External dependencies of CANSPI Library**

Library Routines

- CANSPISetOperationMode
- CANSPIGetOperationMode
- CANSPIInitialize
- CANSPISetBaudRate
- CANSPISetMask
- CANSPISetFilter
- CANSPIread
- CANSPIWrite

The following routines are for an internal use by the library only:

- RegsToCANSPIID
- CANSPIIDToRegs

Be sure to check CANSPI constants necessary for using some of the functions.
### CANSPISetOperationMode

**Prototype**

```c
void CANSPISetOperationMode(char mode, char WAIT);
```

**Returns**

Nothing.

**Description**

Sets the CANSPI module to requested mode.

**Parameters:**

- `mode`: CANSPI module operation mode. Valid values: CANSPI_OP_MODE constants (see CANSPI constants).
- `WAIT`: CANSPI mode switching verification request. If \( \text{WAIT} == 0 \), the call is non-blocking. The function does not verify if the CANSPI module is switched to requested mode or not. Caller must use `CANSPIGetOperationMode` to verify correct operation mode before performing mode specific operation. If \( \text{WAIT} != 0 \), the call is blocking – the function won’t “return” until the requested mode is set.

**Requires**

The CANSPI routines are supported only by MCUs with the SPI module. MCU has to be properly connected to mikroElektronika’s CANSPI Extra Board or similar hardware. See connection example at the bottom of this page.

**Example**

```c
// set the CANSPI module into configuration mode (wait inside CANSPISetOperationMode until this mode is set)
CANSPISetOperationMode(_CANSPI_MODE_CONFIG, 0xFF);
```

---

### CANSPIGetOperationMode

**Prototype**

```c
char CANSPIGetOperationMode();
```

**Returns**

Current operation mode.

**Description**

The function returns current operation mode of the CANSPI module. Check CANSPI_OP_MODE constants (see CANSPI constants) or device datasheet for operation mode codes.

**Requires**

The CANSPI routines are supported only by MCUs with the SPI module. MCU has to be properly connected to mikroElektronika's CANSPI Extra Board or similar hardware. See connection example at the bottom of this page.

**Example**

```c
// check whether the CANSPI module is in Normal mode and if it is do something.
if (CANSPIGetOperationMode() == _CANSPI_MODE_NORMAL) {
    ...
}
```
### CANSPIInitialize

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void CANSPIInitialize( char SJW, char BRP, char PHSEG1, char PHSEG2, char PROPSEG, char CANSPI_CONFIG_FLAGS);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
</tbody>
</table>
| Description | Initializes the CANSPI module.  
Stand-Alone CAN controller in the CANSPI module is set to:  
- Disable CAN capture  
- Continue CAN operation in Idle mode  
- Do not abort pending transmissions  
- Fcan clock: 4*Tcy (Fosc)  
- Baud rate is set according to given parameters  
- CAN mode: Normal  
- Filter and mask registers IDs are set to zero  
- Filter and mask message frame type is set according to CAN_CONFIG_FLAGS value  
- SAM, SEG2PHTS, WAKFIL and DBEN bits are set according to CANSPI_CONFIG_FLAGS value.  
Parameters:  
- SJW as defined in CAN controller's datasheet  
- BRP as defined in CAN controller's datasheet  
- PHSEG1 as defined in CAN controller's datasheet  
- PHSEG2 as defined in CAN controller's datasheet  
- PROPSEG as defined in CAN controller's datasheet  
- CAN_CONFIG_FLAGS is formed from predefined constants (see CANSPI constants) |
| Requires | Global variables:  
- CanSpi_CS: Chip Select line  
- CanSpi_Rst: Reset line  
- CanSpi_CS_Direction: Direction of the Chip Select pin  
- CanSpi_Rst_Direction: Direction of the Reset pin  
must be defined before using this function.  
The CANSPI routines are supported only by MCUs with the SPI module.  
The SPI module needs to be initialized. See the SPI1_Init and SPI1_Init_Advanced routines.  
MCU has to be properly connected to mikroElektronika's CANSPI Extra Board or similar hardware. See connection example at the bottom of this page. |
Example

```c
// CANSPI module connections
sbit CanSpi_CS at RC0_bit;
sbit CanSpi_CS_Direction at TRISC0_bit;
sbit CanSpi_Rst at RC2_bit;
sbit CanSpi_Rst_Direction at TRISC2_bit;
// End CANSPI module connections

// initialize the CANSPI module with the appropriate baud rate and message acceptance flags along with the sampling rules
char CanSPI_Init_Flags;
...
  CanSPI_Init_Flags = _CANSPI_CONFIG_SAMPLE_THRICE & // form value to be used
                     _CANSPI_CONFIG_PHSEG2_PRG_ON &   // with
                     CANSPIInitialize
                     _CANSPI_CONFIG_XTD_MSG &
                     _CANSPI_CONFIG_DBL_BUFFER_ON &
                     _CANSPI_CONFIG_VALID_XTD_MSG;
...
  SPI1_Init();        // initialize SPI module
  CANSPIInitialize(1,3,3,3,1,CanSPI_Init_Flags);   // initialize external CANSPI module
```
# CANSPISetBaudRate

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void CANSPISetBaudRate(char SJW, char BRP, char PHSEG1, char PHSEG2, char PROPSEG, char CANSPI_CONFIG_FLAGS);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
</tbody>
</table>
| Description | Sets the CANSPI module baud rate. Due to complexity of the CAN protocol, you cannot simply force a bps value. Instead, use this function when the CANSPI module is in Config mode.  

  
  *SAM, SEG2PHTS* and *WAKFIL* bits are set according to *CANSPI_CONFIG_FLAGS* value. Refer to datasheet for details.  

  
  Parameters:  
  - *SJW* as defined in CAN controller's datasheet  
  - *BRP* as defined in CAN controller's datasheet  
  - *PHSEG1* as defined in CAN controller's datasheet  
  - *PHSEG2* as defined in CAN controller's datasheet  
  - *PROPSEG* as defined in CAN controller's datasheet  
  - *CAN_CONFIG_FLAGS* is formed from predefined constants (see CANSPI constants) |
| Requires | The CANSPI module must be in Config mode, otherwise the function will be ignored. See CANSPISetOperationMode.  

  
  The CANSPI routines are supported only by MCUs with the SPI module.  

  
  MCU has to be properly connected to mikroElektronika's CANSPI Extra Board or similar hardware. See connection example at the bottom of this page. |
| Example | // set required baud rate and sampling rules  

  
  `char canspi_config_flags;`  

  
  ...  

  
  CANSPISetOperationMode(CANSPI_MODE_CONFIG,0xFF); // set CONFIGURATION mode (CANSPI module must be in config mode for baud rate settings)  

  
  `canspi_config_flags = _CANSPI_CONFIG_SAMPLE_THRICE & _CANSPI_CONFIG_PHSEG2_PRG_ON & _CANSPI_CONFIG_STD_MSG & _CANSPI_CONFIG_DBL_BUFFER_ON & _CANSPI_CONFIG_VALID_XTD_MSG & _CANSPI_CONFIG_LINE_FILTER_OFF;`  

  
  CANSPISetBaudRate(1, 1, 3, 3, 1, canspi_config_flags); |
### CANSPISetMask

**Prototype**

```c
void CANSPISetMask(char CANSPI_MASK, long val, char CANSPI_CONFIG_FLAGS);
```

**Returns**

Nothing.

**Description**

Configures mask for advanced filtering of messages. The parameter `value` is bit-adjusted to the appropriate mask registers.

**Parameters:**
- **CAN_MASK**: CANSPI module mask number. Valid values: `CANSPI_MASK` constants (see CANSPI constants)
- **val**: mask register value
- **CAN_CONFIG_FLAGS**: selects type of message to filter. Valid values:
  - `CANSPI_CONFIG_ALL_VALID_MSG`, `CANSPI_CONFIG_MATCH_MSG_TYPE` and `CANSPI_CONFIG_STD_MSG`,
  - `CANSPI_CONFIG_MATCH_MSG_TYPE` and `CANSPI_CONFIG_XTD_MSG`

(see CANSPI constants)

**Requires**

The CANSPI module must be in Config mode, otherwise the function will be ignored. See CANSPISetOperationMode.

The CANSPI routines are supported only by MCUs with the SPI module.

MCU has to be properly connected to mikroElektronika's CANSPI Extra Board or similar hardware. See connection example at the bottom of this page.

**Example**

```c
// set the appropriate filter mask and message type value
CANSPISetOperationMode(_CANSPI_MODE_CONFIG,0xFF);
// set CONFIGURATION mode (CANSPI module must be in config mode for mask settings)

// Set all B1 mask bits to 1 (all filtered bits are relevant):
 // Note that -1 is just a cheaper way to write 0xFFFFFFFF.
 // Complement will do the trick and fill it up with ones.
CANSPISetMask(_CANSPI_MASK_B1, -1, _CANSPI_CONFIG_MATCH_MSG_TYPE & _CANSPI_CONFIG_XTD_MSG);
```
### CANSPISetFilter

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void CANSPISetFilter(char CANSPI_FILTER, long val, char CANSPI_CONFIG_FLAGS);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
</tbody>
</table>

#### Description

Configures message filter. The parameter `value` is bit-adjusted to the appropriate filter registers.

**Parameters:**

- `CAN_FILTER`: CANSPI module filter number. Valid values: `CANSPI_FILTER` constants (see CANSPI constants)
- `val`: filter register value
- `CAN_CONFIG_FLAGS`: selects type of message to filter. Valid values:
  - `CANSPI_CONFIG_ALL_VALID_MSG`,
  - `CANSPI_CONFIG_MATCH_MSG_TYPE` and `CANSPI_CONFIG_STD_MSG`,
  - `CANSPI_CONFIG_MATCH_MSG_TYPE` and `CANSPI_CONFIG_XTD_MSG`.

(see CANSPI constants)

#### Requires

The CANSPI module must be in Config mode, otherwise the function will be ignored. See CANSPISetOperationMode.

The CANSPI routines are supported only by MCUs with the SPI module.

MCU has to be properly connected to mikroElektronika's CANSPI Extra Board or similar hardware. See connection example at the bottom of this page.

#### Example

```c
// set the appropriate filter value and message type
CANSPISetOperationMode(_CANSPI_MODE_CONFIG, 0xFF);
// set CONFIGURATION mode (CANSPI module must be in config mode for filter settings)

/* Set id of filter B1_F1 to 3: */
CANSPISetFilter(_CANSPI_FILTER_B1_F1, 3, _CANSPI_CONFIG_XTD_MSG);
```
### CANSPIRead

**Prototype**

| char CANSPIRead(long *id, char *rd_data, char *data_len, char *CAN_RX_MSG_FLAGS); |

**Returns**
- 0 if nothing is received
- 0xFF if one of the Receive Buffers is full (message received)

**Description**
If at least one full Receive Buffer is found, it will be processed in the following way:

- Message ID is retrieved and stored to location provided by the `id` parameter
- Message data is retrieved and stored to a buffer provided by the `rd_data` parameter
- Message length is retrieved and stored to location provided by the `data_len` parameter
- Message flags are retrieved and stored to location provided by the `CAN_RX_MSG_FLAGS` parameter

**Parameters:**
- `id`: message identifier storage address
- `rd_data`: data buffer (an array of bytes up to 8 bytes in length)
- `data_len`: data length storage address.
- `CAN_RX_MSG_FLAGS`: message flags storage address

**Requires**
The CANSPI module must be in a mode in which receiving is possible. See CANSPISetOperationMode.

The CANSPI routines are supported only by MCUs with the SPI module.

MCU has to be properly connected to mikroElektronika's CANSPI Extra Board or similar hardware. See connection example at the bottom of this page.

**Example**

```c
// check the CANSPI module for received messages. If any was received do something.
char msg_rcvd, rx_flags, data_len;
char data[8];
long msg_id;
...
CANSPISetOperationMode(CA_NSPI_MODE_NORMAL,0xFF);
// set NORMAL mode (CANSPI module must be in mode in which receive is possible)
...
rx_flags = 0;
// clear message flags
if (msg_rcvd = CANSPIRead(msg_id, data, data_len, rx_flags)) {
    ...
}
```
CANSPIWrite

Prototype

```c
char CANSPIWrite(long id, char *wr_data, char data_len, char CAN_SPI_TX_MSG_FLAGS);
```

Returns

- 0 if all Transmit Buffers are busy
- 0xFF if at least one Transmit Buffer is available

Description

If at least one empty Transmit Buffer is found, the function sends message in the queue for transmission.

Parameters:

- `id`: CAN message identifier. Valid values: 11 or 29 bit values, depending on message type (standard or extended)
- `wr_data`: data to be sent (an array of bytes up to 8 bytes in length)
- `data_len`: data length. Valid values: 1 to 8
- `CAN_RX_MSG_FLAGS`: message flags

Requires

The CANSPI module must be in mode in which transmission is possible. See CANSPISetOperationMode.

The CANSPI routines are supported only by MCUs with the SPI module.

MCU has to be properly connected to mikroElektronika's CANSPI Extra Board or similar hardware. See connection example at the bottom of this page.

Example

```c
// send message extended CAN message with the appropriate ID and data
char tx_flags;
char data[8];
long msg_id;
...
CANSPISetOperationMode(_CANSPI_MODE_NORMAL,0xFF);
// set NORMAL mode (CANSPI must be in mode in which transmission is possible)

tx_flags = _CANSPI_TX_PRIORITY_0 & _CANSPI_TX_XTD_FRAME;
// set message flags
CANSPIWrite(msg_id, data, 2, tx_flags);
```
CANSPI Constants

There is a number of constants predefined in the CANSPI library. You need to be familiar with them in order to be able to use the library effectively. Check the example at the end of the chapter.

CANSPI_OP_MODE

The CANSPI_OP_MODE constants define CANSPI operation mode. Function CANSPISetOperationMode expects one of these as it's argument:

```c
const char
  _CANSPI_MODE_BITS   = 0xE0,   // Use this to access opmode bits
  _CANSPI_MODE_NORMAL = 0x00,
  _CANSPI_MODE_SLEEP  = 0x20,
  _CANSPI_MODE_LOOP   = 0x40,
  _CANSPI_MODE_LISTEN = 0x60,
  _CANSPI_MODE_CONFIG = 0x80;
```

CANSPI_CONFIG_FLAGS

The CANSPI_CONFIG_FLAGS constants define flags related to the CANSPI module configuration. The functions CANSPIInitialize, CANSPISetBaudRate, CANSPISetMask and CANSPISetFilter expect one of these (or a bitwise combination) as their argument:

```c
const char
  _CANSPI_CONFIG_DEFAULT         = 0xFF,   // 11111111
  _CANSPI_CONFIG_PHSEG2_PRG_BIT  = 0x01,
  _CANSPI_CONFIG_PHSEG2_PRG_ON   = 0xFF,   // XXXXXXX1
  _CANSPI_CONFIG_PHSEG2_PRG_OFF  = 0xFE,   // XXXXXXX0
  _CANSPI_CONFIG_LINE_FILTER_BIT = 0x02,
  _CANSPI_CONFIG_LINE_FILTER_ON  = 0xFF,   // XXXXX1XX
  _CANSPI_CONFIG_LINE_FILTER_OFF = 0xFD,   // XXXXX0XX
  _CANSPI_CONFIG_SAMPLE_BIT      = 0x04,
  _CANSPI_CONFIG_SAMPLE_ONCE     = 0xFF,   // XXXXX1XX
  _CANSPI_CONFIG_SAMPLE_THRICE   = 0xFB,   // XXXXX0XX
  _CANSPI_CONFIG_MSG_TYPE_BIT    = 0x08,
  _CANSPI_CONFIG_STD_MSG         = 0xFF,   // XXXX1XXX
  _CANSPI_CONFIG_XTD_MSG         = 0xF7,   // XXXX0XXX
```
_CANSPI_CONFIG_DBL_BUFFER_BIT = 0x10,
_CANSPI_CONFIG_DBL_BUFFER_ON = 0xFF,  // XXX1XXXX
_CANSPI_CONFIG_DBL_BUFFER_OFF = 0xEF,  // XXX0XXXX

_CANSPI_CONFIG_MSG_BITS = 0x60,
_CANSPI_CONFIG_ALL_MSG = 0xFF,  // X11XXXXX
_CANSPI_CONFIG_VALID_XTD_MSG = 0xDF,  // X10XXXXX
_CANSPI_CONFIG_VALID_STD_MSG = 0xBF,  // X01XXXXX
_CANSPI_CONFIG_ALL_VALID_MSG = 0x9F;  // X00XXXXX

You may use bitwise AND (&) to form config byte out of these values. For example:

```
init = _CANSPI_CONFIG_SAMPLE_THRICE &
    _CANSPI_CONFIG_PHSEG2_PRG_ON &
    _CANSPI_CONFIG_STD_MSG &
    _CANSPI_CONFIG_DBL_BUFFER_ON &
    _CANSPI_CONFIG_VALID_XTD_MSG &
    _CANSPI_CONFIG_LINE_FILTER_OFF;
...```

CANSPIInitialize(1, 1, 3, 3, 1, init);  // initialize CANSPI

**CANSPI_TX_MSG_FLAGS**

**CANSPI_TX_MSG_FLAGS** are flags related to transmission of a CAN message:

```
const char
    _CANSPI_TX_PRIORITY_BITS = 0x03,
    _CANSPI_TX_PRIORITY_0 = 0xFC,  // XXXXXXX00
    _CANSPI_TX_PRIORITY_1 = 0xFD,  // XXXXXXX01
    _CANSPI_TX_PRIORITY_2 = 0xFE,  // XXXXXXX10
    _CANSPI_TX_PRIORITY_3 = 0xFF,  // XXXXXXX11

    _CANSPI_TX_FRAME_BIT = 0x08,
    _CANSPI_TX_STD_FRAME = 0xFF,  // XXXXX1XX
    _CANSPI_TX_XTD_FRAME = 0xF7,  // XXXXX0XX

    _CANSPI_TX_RTR_BIT = 0x40,
    _CANSPI_TX_NO_RTR_FRAME = 0xFF,  // X1XXXXXX
    _CANSPI_TX_RTR_FRAME = 0xBF;  // X0XXXXXX
```

You may use bitwise AND (&) to adjust the appropriate flags. For example:

```
/* form value to be used as sending message flag : */
send_config = _CANSPI_TX_PRIORITY_0 &
    _CANSPI_TX_XTD_FRAME &
    _CANSPI_TX_NO_RTR_FRAME;
...
CANSPIWrite(id, data, 1, send_config);
```
**CANSPI_RX_MSG_FLAGS**

*CANSPI_RX_MSG_FLAGS* are flags related to reception of CAN message. If a particular bit is set then corresponding meaning is TRUE or else it will be FALSE.

```c
const char
  _CANSPI_RX_FILTER_BITS = 0x07, // Use this to access filter bits
  _CANSPI_RX_FILTER_1 = 0x00,
  _CANSPI_RX_FILTER_2 = 0x01,
  _CANSPI_RX_FILTER_3 = 0x02,
  _CANSPI_RX_FILTER_4 = 0x03,
  _CANSPI_RX_FILTER_5 = 0x04,
  _CANSPI_RX_FILTER_6 = 0x05,

  _CANSPI_RX_OVERFLOW = 0x08, // Set if Overflowed else cleared
  _CANSPI_RX_INVALID_MSG = 0x10, // Set if invalid else cleared
  _CANSPI_RX_XTD_FRAME = 0x20, // Set if XTD message else cleared
  _CANSPI_RX_RTR_FRAME = 0x40, // Set if RTR message else cleared
  _CANSPI_RX_DBL_BUFFERED = 0x80; // Set if this message was hard
  //ware double-buffered
```

You may use bitwise AND (&) to adjust the appropriate flags. For example:

```c
if ((MsgFlag & _CANSPI_RX_OVERFLOW != 0) {
  ...
  // Receiver overflow has occurred.
  // We have lost our previous message.
}
```

**CANSPI_MASK**

The *CANSPI_MASK* constants define mask codes. Function CANSPISetMask expects one of these as it's argument:

```c
const char
  _CANSPI_MASK_B1 = 0,
  _CANSPI_MASK_B2 = 1;
```

**CANSPI_FILTER**

The *CANSPI_FILTER* constants define filter codes. Functions CANSPISetFilter expects one of these as it's argument:

```c
const char
  _CANSPI_FILTER_B1_F1 = 0,
  _CANSPI_FILTER_B1_F2 = 1,
  _CANSPI_FILTER_B2_F1 = 2,
  _CANSPI_FILTER_B2_F2 = 3,
```
Library Example

This is a simple demonstration of CANSPI Library routines usage. First node initiates the communication with the second node by sending some data to its address. The second node responds by sending back the data incremented by 1. First node then does the same and sends incremented data back to second node, etc.

Code for the first CANSPI node:

```c
unsigned char Can_Init_Flags, Can_Send_Flags, Can_Rcv_Flags; // can flags
unsigned char Rx_Data_Len; // received data length in bytes
char RxTx_Data[8]; // can rx(tx data buffer
char Msg_Rcvd; // reception flag
const long ID_1st = 12111, ID_2nd = 3; // node IDs
long Rx_ID;

// CANSPI module connections
sbit CanSpi_CS at RC0_bit;
sbit CanSpi_CS_Direction at TRISC0_bit;
sbit CanSpi_Rst at RC2_bit;
sbit CanSpi_Rst_Direction at TRISC2_bit;
// End CANSPI module connections

void main() {
    ANSEL = 0; // Configure AN pins as digital I/O
    ANSELEH = 0;

    PORTB = 0; // clear PORTB
    TRISB = 0; // set PORTB as output

    Can_Init_Flags = 0; //
    Can_Send_Flags = 0; // clear flags
    Can_Rcv_Flags = 0; //

    Can_Send_Flags = _CANSPI_TX_PRIORITY_0 & // form value to be used
                    _CANSPI_TX_XTD_FRAME & // with CANSPIWrite
                    _CANSPI_TX_NO_RTR.Frame;

    Can_Init_Flags = _CANSPI_CONFIG_SAMPLE_THRICE & // Form value to be used
                    _CANSPI_CONFIG_PHASEG2_PRG_ON & // with CANSPIInit
                    _CANSPI_CONFIG_XTD_MSG &
                    _CANSPI_CONFIG_DBG_BUFFER_ON &
                    _CANSPI_CONFIG_VALID_XTD_MSG;

    //...
SPI1_Init(); // initialize SPI1 module

CANSPIInitialize(1,3,3,3,1,Can_Init_FLAGS); // Initialize external CAN SPI module
CANSPISetOperationMode(_CANSPI_MODE_CONFIG,0xFF); // set CONFIGURATION mode
CANSPISetMask(_CANSPI_MASK_B1,-1,_CANSPI_CONFIG_XTD_MSG); // set all mask1 bits to ones
CANSPISetMask(_CANSPI_MASK_B2,-1,_CANSPI_CONFIG_XTD_MSG); // set all mask2 bits to ones

CANSPISetFilter(_CANSPI_FILTER_B2_F4,ID_2nd,_CANSPI_CONFIG_XTD_MSG); // set id of filter B2_F4 to 2nd node ID

CANSPISetOperationMode(_CANSPI_MODE_NORMAL,0xFF); // set NORMAL mode

RxTx_Data[0] = 9; // set initial data to be sent

CANSPIWrite(ID_1st, RxTx_Data, 1, Can_Send_Flags); // send initial message

while(1) { // endless loop
    Msg_Rcvd = CANSPIRead(&Rx_ID , RxTx_Data , &Rx_Data_Len, &Can_Rcv_Flags); // receive message
    if ((Rx_ID == ID_2nd) && Msg_Rcvd) {
        // if message received check id
        PORTB = RxTx_Data[0]; // id correct, output data at PORTC
        RxTx_Data[0]++; // increment received data
        Delay_ms(10);
        CANSPIWrite(ID_1st, RxTx_Data, 1, Can_Send_Flags); // send incremented data back
    }
}
Code for the second CANSPI node:

```c
unsigned char Can_Init_Flags, Can_Send_Flags, Can_Rcv_Flags; // can flags
unsigned char Rx_Data_Len;     // received data length in bytes
char RxTx_Data[8];             // can rx/tx data buffer
char Msg_Rcvd;                 // reception flag
const long ID_1st = 12111, ID_2nd = 3;      // node IDs
long Rx_ID;

// CANSPI module connections
sbit CanSpi_CS at RC0_bit;
sbit CanSpi_CS_Direction at TRISC0_bit;
sbit CanSpi_Rst at RC2_bit;
sbit CanSpi_Rst_Direction at TRISC2_bit;
// End CANSPI module connections

void main() {

    ANSEL  = 0;              // Configure AN pins as digital I/O
    ANSELH = 0;
    PORTB = 0;                // clear PORTB
    TRISB = 0;                // set PORTB as output

    Can_Init_Flags = 0;        //
    Can_Send_Flags = 0;        // clear flags
    Can_Rcv_Flags = 0;         //

    Can_Send_Flags = _CANSPI_TX_PRIORITY_0 & // form value to be used
                      _CANSPI_TX_XTD_FRAME & // with CANSPIWrite
                      _CANSPI_TX_NO_RTR_FRAME;

    Can_Init_Flags = _CANSPI_CONFIG_SAMPLE_THRICE & // Form value to be used
                     _CANSPI_CONFIG_PHSEG2_PRG_ON & // with CANSPIInit
                     _CANSPI_CONFIG_XTD_MSG &
                     _CANSPI_CONFIG_DBL_BUFFER_ON &
                     _CANSPI_CONFIG_VALID_XTD_MSG &
                     _CANSPI_CONFIG_LINE_FILTER_OFF;

    SPI1_Init();    // initialize SPI1 module

    CANSPIInitialize(1,3,3,3,1,Can_Init_Flags); // initialize external
                                                   CANSPI module
    CANSPISetOperationMode(_CANSPI_MODE_CONFIG,0xFF); // set CONFIGU-
                                                       RATION mode
    CANSPISetMask(_CANSPI_MASK_B1,-1,_CANSPI_CONFIG_XTD_MSG);// set
                                                             all mask1 bits to ones
    CANSPISetMask(_CANSPI_MASK_B2,-1,_CANSPI_CONFIG_XTD_MSG); // set
```
all mask2 bits to ones

CANSPISetFilter(_CANSPI_FILTER_B2_F3,ID_1st,_CANSPI_CONFIG_XTD_MSG);
// set id of filter B2_F3 to 1st node ID

CANSPISetOperationMode(_CANSPI_MODE_NORMAL,0xFF);// set NORMAL mode

while (1) {                        // endless loop
    Msg_Rcvd = CANSPIRead(&Rx_ID , RxTx_Data , &Rx_Data_Len,
&Can_Rcv_Flags); // receive message
    if ((Rx_ID == ID_1st) && Msg_Rcvd) { // if message received check id
        PORTB = RxTx_Data[0];  // id correct, output data at PORTC
        RxTx_Data[0]++;       // increment received data
        CANSPIWrite(ID_2nd, RxTx_Data, 1, Can_Send.Flags); // send
incremented data back
    }
}

HW Connection

Example of interfacing CAN transceiver MCP2510 with MCU via SPI interface
COMPACT FLASH LIBRARY

The Compact Flash Library provides routines for accessing data on Compact Flash card (abbr. CF further in text). CF cards are widely used memory elements, commonly used with digital cameras. Great capacity and excellent access time of only a few microseconds make them very attractive for microcontroller applications.

In CF card, data is divided into sectors. One sector usually comprises 512 bytes. Routines for file handling, the `Cf_Fat` routines, are not performed directly but successively through 512B buffer.

**Note**: Routines for file handling can be used only with FAT16 file system.

**Note**: Library functions create and read files from the root directory only.

**Note**: Library functions populate both FAT1 and FAT2 tables when writing to files, but the file data is being read from the FAT1 table only; i.e. there is no recovery if the FAT1 table gets corrupted.

**Note**: If MMC/SD card has Master Boot Record (MBR), the library will work with the first available primary (logical) partition that has non-zero size. If MMC/SD card has Volume Boot Record (i.e. there is only one logical partition and no MBRs), the library works with entire card as a single partition. For more information on MBR, physical and logical drives, primary/secondary partitions and partition tables, please consult other resources, e.g. Wikipedia and similar.

**Note**: Before writing operation, make sure not to overwrite boot or FAT sector as it could make your card on PC or digital camera unreadable. Drive mapping tools, such as Winhex, can be of great assistance.
The following variables must be defined in all projects using Compact Flash Library:

<table>
<thead>
<tr>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compact Flash Data Port</td>
<td>char CF_Data_Port at PORTD;</td>
</tr>

#### Requires

Global variables:

- `CF_Data_Port` : Compact Flash data port
- `CF_RDY` : Ready signal line
- `CF_WE` : Write enable signal line
- `CF_OE` : Output enable signal line
- `CF_CD1` : Chip detect signal line
- `CF_CE1` : Enable signal line
- `CF_A2` : Address pin 2
- `CF_A1` : Address pin 1
- `CF_A0` : Address pin 0
- `CF_RDY_direction` : Direction of the Ready pin
- `CF_WE_direction` : Direction of the Write enable pin
- `CF_OE_direction` : Direction of the Output enable pin
- `CF_CD1_direction` : Direction of the Chip detect pin
- `CF_CE1_direction` : Direction of the Chip enable pin
- `CF_A2_direction` : Direction of the Address 2 pin
- `CF_A1_direction` : Direction of the Address 1 pin
- `CF_A0_direction` : Direction of the Address 0 pin

...must be defined before using this function.

#### Example

```c
// set compact flash pinout
char Cf_Data_Port at PORTD;

sbit CF_RDY at RB7_bit;
sbit CF_WE at RB6_bit;
sbit CF_OE at RB5_bit;
sbit CF_CD1 at RB4_bit;
sbit CF_CE1 at RB3_bit;
sbit CF_A2 at RB2_bit;
sbit CF_A1 at RB1_bit;
sbit CF_A0 at RB0_bit;

sbit CF_RDY_direction at TRISB7_bit;
sbit CF_WE_direction at TRISB6_bit;
sbit CF_OE_direction at TRISB5_bit;
sbit CF_CD1_direction at TRISB4_bit;
sbit CF_CE1_direction at TRISB3_bit;
sbit CF_A2_direction at TRISB2_bit;
sbit CF_A1_direction at TRISB1_bit;
sbit CF_A0_direction at TRISB0_bit;
// end of compact flash pinout
...
Cf_Init();     // initialize CF
```
### Cf_Detect

**Prototype**
```c
unsigned short Cf_Detect(void);
```

**Returns**
- 1 - if CF card was detected
- 0 - otherwise

**Description**
Checks for presence of CF card by reading the chip detect pin.

**Requires**
The corresponding MCU ports must be appropriately initialized for CF card. See Cf_Init.

**Example**
```c
// Wait until CF card is inserted:
do
    asm nop;
while (!Cf_Detect());
```

### Cf_Enable

**Prototype**
```c
void Cf_Enable(void);
```

**Returns**
Nothing.

**Description**
Enables the device. Routine needs to be called only if you have disabled the device by means of the Cf_Disable routine. These two routines in conjunction allow you to free/occupy data line when working with multiple devices.

**Requires**
The corresponding MCU ports must be appropriately initialized for CF card. See Cf_Init.

**Example**
```c
// enable compact flash
Cf_Enable();
```

### Cf_Disable

**Prototype**
```c
void Cf_Disable(void);
```

**Returns**
Nothing.

**Description**
Routine disables the device and frees the data lines for other devices. To enable the device again, call Cf_Enable. These two routines in conjunction allow you to free/occupy data line when working with multiple devices.

**Requires**
The corresponding MCU ports must be appropriately initialized for CF card. See Cf_Init.

**Example**
```c
// disable compact flash
Cf_Disable();
```
### Cf_Read_Init

**Prototype**

```c
void Cf_Read_Init(unsigned long address, unsigned short sector_count);
```

**Returns**

Nothing.

**Description**

Initializes CF card for reading.

**Parameters:**

- `address`: the first sector to be prepared for reading operation.
- `sector_count`: number of sectors to be prepared for reading operation.

**Requires**

The corresponding MCU ports must be appropriately initialized for CF card. See Cf_Init.

**Example**

```c
// initialize compact flash for reading from sector 590
Cf_Read_Init(590, 1);
```

### Cf_Read_Byte

**Prototype**

```c
unsigned short Cf_Read_Byte(void);
```

**Returns**

Returns a byte read from Compact Flash sector buffer.

**Note:** Higher byte of the `unsigned` return value is cleared.

**Description**

Reads one byte from Compact Flash sector buffer location currently pointed to by internal read pointers. These pointers will be autoincremented upon reading.

**Requires**

The corresponding MCU ports must be appropriately initialized for CF card. See Cf_Init.

CF card must be initialized for reading operation. See Cf_Read_Init.

**Example**

```c
// Read a byte from compact flash:
char data;
...
data = Cf_Read_Byte();
```
### Cf_Write_Init

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void Cf_Write_Init(unsigned long address, unsigned short sectcnt);</code></th>

</tr>
<tr>
<td></td>
<td>Cf_Write_Byte(data);</td>
</tr>
</tbody>
</table>
### Cf_Read_Sector

**Prototype**

```c
void Cf_Read_Sector(unsigned long sector_number, unsigned short *buffer);
```

**Returns**

Nothing.

**Description**

Reads one sector (512 bytes). Read data is stored into `buffer` provided by the `buffer` parameter.

**Parameters:**

- `sector_number`: sector to be read.
- `buffer`: data buffer of at least 512 bytes in length.

**Requires**

The corresponding MCU ports must be appropriately initialized for CF card. See `Cf_Init`.

**Example**

```c
// read sector 22
unsigned short data[512];
...
Cf_Read_Sector(22, data);
```

### Cf_Write_Sector

**Prototype**

```c
void Cf_Write_Sector(unsigned long sector_number, unsigned short *buffer);
```

**Returns**

Nothing.

**Description**

Writes 512 bytes of data provided by the `buffer` parameter to one CF sector.

**Parameters:**

- `sector_number`: sector to be written to.
- `buffer`: data buffer of 512 bytes in length.

**Requires**

The corresponding MCU ports must be appropriately initialized for CF card. See `Cf_Init`.

**Example**

```c
// write to sector 22
unsigned short data[512];
...
Cf_Write_Sector(22, data);
```
### Cf_Fat_Init

**Prototype**

```c
unsigned short Cf_Fat_Init();
```

**Returns**

- 0 - if CF card was detected and successfully initialized
- 1 - if FAT16 boot sector was not found
- 255 - if card was not detected

**Description**

Initializes CF card, reads CF FAT16 boot sector and extracts necessary data needed by the library.

**Requires**

Nothing.

**Example**

```c
// Init the FAT library
if (!Cf_Fat_Init()) {    // Init the FAT library
...
}
```

### Cf_Fat_QuickFormat

**Prototype**

```c
unsigned char Cf_Fat_QuickFormat(char *cf_fat_label);
```

**Returns**

- 0 - if CF card was detected, successfully formatted and initialized
- 1 - if FAT16 format was unsuccessful
- 255 - if card was not detected

**Description**

Formats to FAT16 and initializes CF card.

**Parameters:**

- `cf_fat_label`: volume label (11 characters in length). If less than 11 characters are provided, the label will be padded with spaces. If null string is passed, the volume will not be labeled.

**Note:** This routine can be used instead or in conjunction with Cf_Fat_Init routine.

**Note:** If CF card already contains a valid boot sector, it will remain unchanged (except volume label field) and only FAT and ROOT tables will be erased. Also, the new volume label will be set.

**Requires**

Nothing.

**Example**

```c
//--- format and initialize the FAT library ---
if (!Cf_Fat_QuickFormat(cf_fat_label)) {
...
}
```
Cf_Fat_Assign

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned short Cf_Fat_Assign(char *filename, char file_cre_attr);</code></th>
</tr>
</thead>
</table>
| Returns   | - 0 if file does not exist and no new file is created.  
- 1 if file already exists or file does not exist but a new file is created. |
| Description | Assigns file for file operations (read, write, delete...). All subsequent file operations will be applied over the assigned file. |

Parameters:
- `filename`: name of the file that should be assigned for file operations. The file name should be in DOS 8.3 (file_name.extension) format. The file name and extension will be automatically padded with spaces by the library if they have less than length required (i.e. "mikro.tx" -> "mikro .tx "), so the user does not have to take care of that. The file name and extension are case insensitive. The library will convert them to proper case automatically, so the user does not have to take care of that.
Also, in order to keep backward compatibility with the first version of this library, file names can be entered as UPPERCASE string of 11 bytes in length with no dot character between the file name and extension (i.e. "MIKROELETXT" -> MIKROELE.TXT). In this case the last 3 characters of the string are considered to be file extension.
- `file_cre_attr`: file creation and attributes flags. Each bit corresponds to the appropriate file attribut::

<table>
<thead>
<tr>

</tr>
<tr>
<td>4</td>
<td>0x10</td>
<td>Subdirectory</td>
</tr>
<tr>
<td>5</td>
<td>0x20</td>
<td>Archive</td>
</tr>
<tr>
<td>6</td>
<td>0x40</td>
<td>Device (internal use only, never found on disk)</td>
</tr>
<tr>
<td>7</td>
<td>0x80</td>
<td>File creation flag. If the file does not exist and this flag is set, a new file with specified name will be created.</td>
</tr>
</tbody>
</table>

**Note**: Long File Names (LFN) are not supported.

**Requires**: CF card and CF library must be initialized for file operations. See Cf_Fat_Init.

**Example**: // create file with archive attributes if it does not already exist
Cf_Fat_Assign("MIKRO007.TXT",0xA0);
## Cf_Fat_Reset

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void Cf_Fat_Reset(unsigned long *size);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Opens currently assigned file for reading.</td>
</tr>
<tr>
<td>Description</td>
<td>Parameters:</td>
</tr>
<tr>
<td></td>
<td>- size: buffer to store file size to. After file has been open for reading its size is returned through this parameter.</td>
</tr>
<tr>
<td>Requires</td>
<td>CF card and CF library must be initialized for file operations. See Cf_Fat_Init. File must be previously assigned. See Cf_Fat_Assign.</td>
</tr>
<tr>
<td>Example</td>
<td>unsigned long size;</td>
</tr>
<tr>
<td></td>
<td>...</td>
</tr>
<tr>
<td></td>
<td>Cf_Fat_Reset(size);</td>
</tr>
</tbody>
</table>

## Cf_Fat_Read

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void Cf_Fat_Read(unsigned short *bdata);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Reads a byte from currently assigned file opened for reading. Upon function execution file pointers will be set to the next character in the file.</td>

<td>char character;</td>
</tr>
<tr>
<td></td>
<td>...</td>
</tr>
<tr>
<td></td>
<td>Cf_Fat_Read(&amp;character);</td>
</tr>
</tbody>
</table>
### Cf_Fat_Rewrite

**Prototype**

```c
void Cf_Fat_Rewrite();
```

**Returns**

Nothing.

**Description**

Opens currently assigned file for writing. If the file is not empty its content will be erased.

**Requires**

CF card and CF library must be initialized for file operations. See Cf_Fat_Init. The file must be previously assigned. See Cf_Fat_Assign.

**Example**

```c
// open file for writing
Cf_Fat_Rewrite();
```

### Cf_Fat_Append

**Prototype**

```c
void Cf_Fat_Append();
```

**Returns**

Nothing.

**Description**

Opens currently assigned file for appending. Upon this function execution file pointers will be positioned after the last byte in the file, so any subsequent file writing operation will start from there.

**Requires**

CF card and CF library must be initialized for file operations. See Cf_Fat_Init. File must be previously assigned. See Cf_Fat_Assign.

**Example**

```c
// open file for appending
Cf_Fat_Append();
```

### Cf_Fat_Delete

**Prototype**

```c
void Cf_Fat_Delete();
```

**Returns**

Nothing.

**Description**

Deletes currently assigned file from CF card.

**Requires**

CF card and CF library must be initialized for file operations. See Cf_Fat_Init. File must be previously assigned. See Cf_Fat_Assign.

**Example**

```c
// delete current file
Cf_Fat_Delete();
```
### Cf_Fat_Write

**Prototype**

```c
void Cf_Fat_Write(char *fdata, unsigned data_len);
```

**Returns**

Nothing.

**Description**

Writes requested number of bytes to currently assigned file opened for writing.

**Parameters**:

- `fdata`: data to be written.
- `data_len`: number of bytes to be written.

**Requires**

CF card and CF library must be initialized for file operations. See Cf_Fat_Init.

File must be previously assigned. See Cf_Fat_Assign.

File must be open for writing. See Cf_Fat_Rewrite or Cf_Fat_Append.

**Example**

```c
char file_contents[42];
...
Cf_Fat_Write(file_contents, 42); // write data to the assigned file
```

### Cf_Fat_Set_File_Date

**Prototype**

```c
void Cf_Fat_Set_File_Date(unsigned int year, unsigned short month, unsigned short day, unsigned short hours, unsigned short mins, unsigned short seconds);
```

**Returns**

Nothing.

**Description**

Sets the date/time stamp. Any subsequent file writing operation will write this stamp to currently assigned file’s time/date attributes.

**Parameters**:

- `year`: year attribute. Valid values: 1980-2107
- `month`: month attribute. Valid values: 1-12
- `day`: day attribute. Valid values: 1-31
- `hours`: hours attribute. Valid values: 0-23
- `mins`: minutes attribute. Valid values: 0-59
- `seconds`: seconds attribute. Valid values: 0-59

**Requires**

CF card and CF library must be initialized for file operations. See Cf_Fat_Init.

File must be previously assigned. See Cf_Fat_Assign.

File must be open for writing. See Cf_Fat_Rewrite or Cf_Fat_Append.

**Example**

```c
Cf_Fat_Set_File_Date(2005,9,30,17,41,0);
```
### Cf_Fat_Get_File_Date

**Prototype**

```c
void Cf_Fat_Get_File_Date(unsigned int *year, unsigned short *month, unsigned short *day, unsigned short *hours, unsigned short *mins);
```

**Description**

Reads time/date attributes of currently assigned file.

Parameters:
- `year`: buffer to store year attribute to. Upon function execution year attribute is returned through this parameter.
- `month`: buffer to store month attribute to. Upon function execution month attribute is returned through this parameter.
- `day`: buffer to store day attribute to. Upon function execution day attribute is returned through this parameter.
- `hours`: buffer to store hours attribute to. Upon function execution hours attribute is returned through this parameter.
- `mins`: buffer to store minutes attribute to. Upon function execution minutes attribute is returned through this parameter.

**Requires**

CF card and CF library must be initialized for file operations. See Cf_Fat_Init. File must be previously assigned. See Cf_Fat_Assign.

**Example**

```c
unsigned year;
char month, day, hours, mins;
...
Cf_Fat_Get_File_Date(&year, &month, &day, &hours, &mins);
```

### Cf_Fat_Get_File_Size

**Prototype**

```c
unsigned long Cf_Fat_Get_File_Size();
```

**Returns**

Size of the currently assigned file in bytes.

**Description**

This function reads size of currently assigned file in bytes.

**Requires**

CF card and CF library must be initialized for file operations. See Cf_Fat_Init. File must be previously assigned. See Cf_Fat_Assign.

**Example**

```c
unsigned long my_file_size;
...
my_file_size = Cf_Fat_Get_File_Size();
```
Prototype: `unsigned long Cf_Fat_Get_Swap_File(unsigned long sectors_cnt, char *filename, char file_attr);`

Returns:
- Number of the start sector for the newly created swap file, if there was enough free space on CF card to create file of required size.
- 0 otherwise

Description:
This function is used to create a swap file of predefined name and size on the CF media. If a file with specified name already exists on the media, search for consecutive sectors will ignore sectors occupied by this file. Therefore, it is recommended to erase such file if it exists before calling this function. If it is not erased and there is still enough space for a new swap file, this function will delete it after allocating new memory space for a new swap file.

The purpose of the swap file is to make reading and writing to CF media as fast as possible, by using the Cf_Read_Sector() and Cf_Write_Sector() functions directly, without potentially damaging the FAT system. Swap file can be considered as a "window" on the media where the user can freely write/read data. Its main purpose in the mikroC's library is to be used for fast data acquisition; when the time-critical acquisition has finished, the data can be re-written into a "normal" file, and formatted in the most suitable way.

Parameters:
- `sectors_cnt`: number of consecutive sectors that user wants the swap file to have.
- `filename`: name of the file that should be assigned for file operations. The file name should be in DOS 8.3 (file_name.extension) format. The file name and extension will be automatically padded with spaces by the library if they have less than length required (i.e. "mikro.tx" -> "mikro .tx "), so the user does not have to take care of that. The file name and extension are case insensitive. The library will convert them to proper case automatically, so the user does not have to take care of that. Also, in order to keep backward compatibility with the first version of this library, file names can be entered as UPPERCASE string of 11 bytes in length with no dot character between the file name and extension (i.e. "MIKROELETXT" -> MIKROELE.TXT). In this case the last 3 characters of the string are considered to be file extension.
- `file_attr`: file creation and attributes flags. Each bit corresponds to the appropriate file attribut:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Mask</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0x01</td>
<td>Read Only</td>
</tr>
<tr>
<td>1</td>
<td>0x02</td>
<td>Hidden</td>
</tr>
<tr>
<td>2</td>
<td>0x04</td>
<td>System</td>
</tr>
<tr>
<td>3</td>
<td>0x08</td>
<td>Volume Label</td>
</tr>
<tr>
<td>4</td>
<td>0x10</td>
<td>Subdirectory</td>
</tr>
<tr>
<td>5</td>
<td>0x20</td>
<td>Archive</td>
</tr>
<tr>
<td>6</td>
<td>0x40</td>
<td>Device (internal use only, never found on disk)</td>
</tr>
<tr>
<td>7</td>
<td>0x80</td>
<td>Not used</td>
</tr>
</tbody>
</table>

Note: Long File Names (LFN) are not supported.
The following example demonstrates various aspects of the Cf_Fat16 library: Creation of new file and writing down to it; Opening existing file and re-writing it (writing from start-of-file); Opening existing file and appending data to it (writing from end-of-file); Opening a file and reading data from it (sending it to USART terminal); Creating and modifying several files at once;

```c
// set compact flash pinout
char Cf_Data_Port at PORTD;

sbit CF_RDY at RB7_bit;
sbit CF_WE at RB6_bit;
sbit CF_OE at RB5_bit;
sbit CF_CD1 at RB4_bit;
sbit CF_CE1 at RB3_bit;
sbit CF_A2 at RB2_bit;
sbit CF_A1 at RB1_bit;
sbit CF_A0 at RB0_bit;

sbit CF_RDY_direction at TRISB7_bit;
sbit CF_WE_direction at TRISB6_bit;
sbit CF_OE_direction at TRISB5_bit;
sbit CF_CD1_direction at TRISB4_bit;
sbit CF_CE1_direction at TRISB3_bit;
sbit CF_A2_direction at TRISB2_bit;
sbit CF_A1_direction at TRISB1_bit;
sbit CF_A0_direction at TRISB0_bit;
// end of cf pinout

const LINE_LEN = 39;
char err_txt[20] = "FAT16 not found";
char file_contents[LINE_LEN] = "XX CF FAT16 library by Anton Rieckertn";
```

### Requires

- CF card and CF library must be initialized for file operations. See Cf_Fat_Init.

---

### Library Example

The example tries to create a swap file with archive attribute, whose size will be at least 1000 sectors. If it succeeds, it sends the number of start sector over UART.

```c
unsigned long size;
...
size = Cf_Fat_Get_Swap_File(1000, "mikroE.txt", 0x20);
if (size) {
    UART_Write(0xAA);
    UART_Write(Lo(size));
    UART_Write(Hi(size));
    UART_Write(Higher(size));
    UART_Write(Highest(size));
    UART_Write(0xAA);
}
```
```c
char filename[14] = "MIKRO00x.TXT"; // File names
unsigned short loop, loop2;
unsigned long i, size;
char Buffer[512];

// UART1 write text and new line (carriage return + line feed)
void UART1_Write_Line(char *uart_text) {
    UART1_Write_Text(uart_text);
    UART1_Write(13);
    UART1_Write(10);
}

// Creates new file and writes some data to it
void M_Create_New_File() {
    filename[7] = 'A';
    Cf_Fat_Assign(&filename, 0xA0); // Find existing file or create a new one
    Cf_Fat_Rewrite(); // To clear file and start with new data
    for(loop = 1; loop <= 99; loop++) {
        UART1_Write('.');
        file_contents[0] = loop / 10 + 48;
        file_contents[1] = loop % 10 + 48;
        Cf_Fat_Write(file_contents, LINE_LEN-1); // write data to the assigned file
    }
}

// Creates many new files and writes data to them
void M_Create_Multiple_Files() {
    for(loop2 = 'B'; loop2 <= 'Z'; loop2++) {
        UART1_Write(loop2); // signal the progress
        filename[7] = loop2; // set filename
        Cf_Fat_Assign(&filename, 0xA0); // find existing file or create a new one
        Cf_Fat_Rewrite(); // To clear file and start with new data
        for(loop = 1; loop <= 44; loop++) {
            file_contents[0] = loop / 10 + 48;
            file_contents[1] = loop % 10 + 48;
            Cf_Fat_Write(file_contents, LINE_LEN-1); // write data to the assigned file
        }
    }
}

// Opens an existing file and rewrites it
void M_Open_File_Rewrite() {
    filename[7] = 'C';
    Cf_Fat_Assign(&filename, 0);
    Cf_Fat_Rewrite();
    for(loop = 1; loop <= 55; loop++) {
```
file_contents[0] = loop / 10 + 65;
file_contents[1] = loop % 10 + 65;
Cf_Fat_Write(file_contents, LINE_LEN-1); // write data to the
assigned file
}
}

// Opens an existing file and appends data to it
// (and alters the date/time stamp)
void M_Open_File_Append() {
    filename[7] = 'B';
    Cf_Fat_Assign(&filename, 0);
    Cf_Fat_Set_File_Date(2005,6,21,10,35,0);
    Cf_Fat_Append(); // Prepare file for append
    Cf_Fat_Write(" for mikroElektronika 2005n", 27); // Write data to
assigned file
}

// Opens an existing file, reads data from it and puts it to UART
void M_Open_File_Read() {
    char character;

    filename[7] = 'B';
    Cf_Fat_Assign(&filename, 0);

EEPROM LIBRARY

EEPROM data memory is available with a number of PIC MCUs. *mikroC PRO for PIC* includes library for comfortable work with EEPROM.

Library Routines

- Eeprom_Read
- Eeprom_Write

**EEPROM_Read**

<table>
<thead>
<tr>
<th>Prototype</th>
<th>unsigned short EEPROM_Read(unsigned int address);</th>
</tr>
</thead>
<tbody>
<tr>

Library Example

The example demonstrates use of EEPROM Library.

```c
char ii;             // loop variable

void main(){
    ANSEL =  0;           // Configure AN pins as digital I/O
    ANSELH = 0;

    PORTB = 0;
    PORTC = 0;
    PORTD = 0;

    TRISB = 0;
    TRISC = 0;
    TRISD = 0;

    for(ii = 0; ii < 32; ii++)  // Fill data buffer
        EEPROM_Write(0x80+ii, ii); // Write data to address 0x80+ii

    EEPROM_Write(0x02,0xAA);     // Write some data at address 2
    EEPROM_Write(0x50,0x55);      // Write some data at address 0150

    Delay_ms(1000);              // Blink PORTB and PORTC diodes
    PORTB = 0xFF;               // to indicate reading start
    PORTC = 0xFF;
    Delay_ms(1000);
    PORTB = 0x00;
    PORTC = 0x00;
    Delay_ms(1000);

    PORTB = EEPROM_Read(0x02);  // Read data from address 2 and
    display it on PORTB
    PORTC = EEPROM_Read(0x50);  // Read data from address 0x50 and
    display it on PORTC

    Delay_ms(1000);

    for(ii = 0; ii < 32; ii++) { // Read 32 bytes block from address 0x80
        PORTD = EEPROM_Read(0x80+ii); // and display data on PORTD
        Delay_ms(250);
    }
}
```
CHAPTER 7
Libraries

ETHERNET PIC18FxxJ60 LIBRARY

PIC18FxxJ60 family of microcontrollers feature an embedded Ethernet controller module. This is a complete connectivity solution, including full implementations of both Media Access Control (MAC) and Physical Layer transceiver (PHY) modules. Two pulse transformers and a few passive components are all that are required to connect the microcontroller directly to an Ethernet network.

The Ethernet module meets all of the IEEE 802.3 specifications for 10-BaseT connectivity to a twisted-pair network. It incorporates a number of packet filtering schemes to limit incoming packets. It also provides an internal DMA module for fast data throughput and hardware assisted IP checksum calculations. Provisions are also made for two LED outputs to indicate link and network activity.

This library provides the possibility to easily utilize ethernet feature of the above mentioned MCUs.

Ethernet PIC18FxxJ60 library supports:

- IPv4 protocol.
- ARP requests.
- ICMP echo requests.
- UDP requests.
- TCP requests (no stack, no packet reconstruction).
- ARP client with cache.
- DNS client.
- UDP client.
- DHCP client.
- packet fragmentation is NOT supported.

Note: Global library variable Ethernet_userTimerSec is used to keep track of time for all client implementations (ARP, DNS, UDP and DHCP). It is user responsibility to increment this variable each second in it's code if any of the clients is used.

Note: For advanced users there are header files ("eth_j60LibDef.h" and "eth_j60LibPrivate.h") in Uses\P18 folder of the compiler with description of all routines and global variables, relevant to the user, implemented in the Ethernet PIC18FxxJ60 Library.
Library Routines

- Ethernet_Init
- Ethernet_Enable
- Ethernet_Disable
- Ethernet_doPacket
- Ethernet_putByte
- Ethernet_putBytes
- Ethernet_putString
- Ethernet_putConstString
- Ethernet_putConstBytes
- Ethernet_getByte
- Ethernet_getBytes
- Ethernet_UserTCP
- Ethernet_UserUDP
- Ethernet_getIpAddress
- Ethernet_getGwIpAddress
- Ethernet_getDnsIpAddress
- Ethernet_getIpMask
- Ethernet_confNetwork
- Ethernet_arpResolve
- Ethernet_sendUDP
- Ethernet_dnsResolve
- Ethernet_initDHCP
- Ethernet_doDHCPLeaseTime
- Ethernet_renewDHCP
**Ethernet_Init**

**Prototype**

| void Ethernet_Init(unsigned char *mac, unsigned char *ip, unsigned char fullDuplex); |

**Returns**

Nothing.

**Description**

This is MAC module routine. It initializes Ethernet controller. This function is internally split into 2 parts to help linker when coming short of memory.

Ethernet controller settings (parameters not mentioned here are set to default):

- receive buffer start address: 0x0000.
- receive buffer end address: 0x19AD.
- transmit buffer start address: 0x19AE.
- transmit buffer end address: 0x1FFF.
- RAM buffer read/write pointers in auto-increment mode.
- receive filters set to default: CRC + MAC Unicast + MAC Broadcast in OR mode.
- flow control with TX and RX pause frames in full duplex mode.
- frames are padded to 60 bytes + CRC.
- maximum packet size is set to 1518.
- Back-to-Back Inter-Packet Gap: 0x15 in full duplex mode; 0x12 in half duplex mode.
- Non-Back-to-Back Inter-Packet Gap: 0x0012 in full duplex mode; 0x0C12 in half duplex mode.
- half duplex loopback disabled.
- LED configuration: default (LEDA-link status, LEDB-link activity).

**Parameters:**

- mac: RAM buffer containing valid MAC address.
- ip: RAM buffer containing valid IP address.
- fullDuplex: ethernet duplex mode switch. Valid values: 0 (half duplex mode) and 1 (full duplex mode).

**Note:** If a DHCP server is to be used, IP address should be set to 0.0.0.0.

**Requires**

Nothing.

**Example**

```
#define Ethernet_HALFDUPLEX 0
#define Ethernet_FULLDUPLEX 1

unsigned char myMacAddr[6] = {0x00, 0x14, 0xA5, 0x76, 0x19, 0x3f}; // my MAC address
unsigned char myIpAddr = {192, 168, 1, 60}; // my IP addr

Ethernet_Init(myMacAddr, myIpAddr, Ethernet_FULLDUPLEX);
```
### Ethernet_Enable

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void Ethernet_Enable(unsigned char enFlt);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
</tbody>
</table>
| Description     | This is MAC module routine. This routine enables appropriate network traffic on the MCU's internal Ethernet module by the means of it's receive filters (unicast, multicast, broadcast, crc). Specific type of network traffic will be enabled if a corresponding bit of this routine's input parameter is set. Therefore, more than one type of network traffic can be enabled at the same time. For this purpose, predefined library constants (see the table below) can be ORed to form appropriate input value. Parameters:  
- enFlt: network traffic/receive filter flags. Each bit corresponds to the appropriate network traffic/receive filter: |
<table>
<thead>
<tr>
<th>Bit Mask</th>
<th>Description</th>
<th>Predefined library const</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x01</td>
<td>MAC Broadcast traffic/receive filter flag. When set, MAC broadcast traffic will be enabled.</td>
<td>_Ethernet_BROADCAST</td>
</tr>
<tr>
<td>0x02</td>
<td>MAC Multicast traffic/receive filter flag. When set, MAC multicast traffic will be enabled.</td>
<td>_Ethernet_MULTICAST</td>
</tr>
<tr>
<td>0x04</td>
<td>not used</td>
<td>none</td>
</tr>
<tr>
<td>0x08</td>
<td>not used</td>
<td>none</td>
</tr>
<tr>
<td>0x10</td>
<td>not used</td>
<td>none</td>
</tr>
<tr>
<td>0x20</td>
<td>CRC check flag. When set, packets with invalid CRC field will be discarded.</td>
<td>_Ethernet_CRC</td>
</tr>
<tr>
<td>0x40</td>
<td>not used</td>
<td>none</td>
</tr>
<tr>
<td>0x80</td>
<td>MAC Unicast traffic/receive filter flag. When set, MAC unicast traffic will be enabled.</td>
<td>_Ethernet_UNICAST</td>
</tr>
</tbody>
</table>

**Note:** Advance filtering available in the MCU's internal Ethernet module such as Pattern Match, Magic Packet and Hash Table can not be enabled by this routine. Additionally, all filters, except CRC, enabled with this routine will work in OR mode, which means that packet will be received if any of the enabled filters accepts it.

**Note:** This routine will change receive filter configuration on-the-fly. It will not, in any way, mess with enabling/disabling receive/transmit logic or any other part of the MCU's internal Ethernet module. The MCU's internal Ethernet module should be properly configured by the means of Ethernet_Init routine.
### Ethernet_Disable

**Requires**
Ethernet module has to be initialized. See Ethernet_Init.

**Example**

```c
Ethernet_Enable(_Ethernet_CRC | _Ethernet_UNICAST); // enable CRC checking and Unicast traffic
```

**Prototype**

```c
void Ethernet_Enable(unsigned char enFlt);
```

**Returns**
Nothing.

This is MAC module routine. This routine disables appropriate network traffic on the MCU's internal Ethernet module by the means of it's receive filters (unicast, multicast, broadcast, crc). Specific type of network traffic will be disabled if a corresponding bit of this routine's input parameter is set. Therefore, more than one type of network traffic can be disabled at the same time. For this purpose, predefined library constants (see the table below) can be ORed to form appropriate input value.

Parameters:
- `enFlt`: network traffic/receive filter flags. Each bit corresponds to the appropriate network traffic/receive filter:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Mask</th>
<th>Description</th>
<th>Predefined library const</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0x01</td>
<td>MAC Broadcast traffic/receive filter flag. When set, MAC broadcast traffic will be disabled.</td>
<td>_Ethernet_BROADCAST</td>
</tr>
<tr>
<td>1</td>
<td>0x02</td>
<td>MAC Multicast traffic/receive filter flag. When set, MAC multicast traffic will be disabled.</td>
<td>_Ethernet_MULTICAST</td>
</tr>
<tr>
<td>2</td>
<td>0x04</td>
<td>not used</td>
<td>none</td>
</tr>
<tr>
<td>3</td>
<td>0x08</td>
<td>not used</td>
<td>none</td>
</tr>
<tr>
<td>4</td>
<td>0x10</td>
<td>not used</td>
<td>none</td>
</tr>
<tr>
<td>5</td>
<td>0x20</td>
<td>CRC check flag. When set, CRC check will be disabled and packets with invalid CRC field will be accepted.</td>
<td>_Ethernet_CRC</td>
</tr>
<tr>
<td>6</td>
<td>0x40</td>
<td>not used</td>
<td>none</td>
</tr>
<tr>
<td>7</td>
<td>0x80</td>
<td>MAC Unicast traffic/receive filter flag. When set, MAC unicast traffic will be disabled.</td>
<td>_Ethernet_UNICAST</td>
</tr>
</tbody>
</table>

**Note:** Advance filtering available in the MCU's internal Ethernet module such as Pattern Match, Magic Packet and Hash Table can not be disabled by this routine.

**Note:** This routine will change receive filter configuration on-the-fly. It will not, in any way, mess with enabling/disabling receive/transmit logic or any other part of the MCU's internal Ethernet module. The MCU's internal Ethernet module should be properly configured by the means of Ethernet_Init routine.
<table>
<thead>
<tr>
<th>Requires</th>
<th>Ethernet module has to be initialized. See Ethernet_Init.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example</td>
<td>Ethernet_Disable(_Ethernet_CRC</td>
</tr>
</tbody>
</table>

### Ethernet_doPacket

<table>
<thead>
<tr>
<th>Prototype</th>
<th>unsigned char Ethernet_doPacket();</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>upon successful packet processing (zero packets received or received packet processed successfully).</td>
</tr>
<tr>
<td>1</td>
<td>upon reception error or receive buffer corruption. Ethernet controller needs to be restarted.</td>
</tr>
<tr>
<td>2</td>
<td>received packet was not sent to us (not our IP, nor IP broadcast address).</td>
</tr>
<tr>
<td>3</td>
<td>received IP packet was not IPv4.</td>
</tr>
<tr>
<td>4</td>
<td>received packet was of type unknown to the library.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Description</th>
<th>This is MAC module routine. It processes next received packet if such exists. Packets are processed in the following manner:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- ARP &amp; ICMP requests are replied automatically.</td>
</tr>
<tr>
<td></td>
<td>- upon TCP request the Ethernet_UserTCP function is called for further processing.</td>
</tr>
<tr>
<td></td>
<td>- upon UDP request the Ethernet_UserUDP function is called for further processing.</td>
</tr>
</tbody>
</table>

**Note**: Ethernet_doPacket must be called as often as possible in user's code.

<table>
<thead>
<tr>
<th>Requires</th>
<th>Ethernet module has to be initialized. See Ethernet_Init.</th>
</tr>
</thead>
</table>
| Example  | if (Ethernet_doPacket() == 0) { // process received packets  
|          | }                                                      |
## Ethernet_putByte

**Prototype**

```c
void Ethernet_putByte(unsigned char v);
```

**Returns**

Nothing.

**Description**

This is MAC module routine. It stores one byte to address pointed by the current Ethernet controller's write pointer (EWRPT).

Parameters:
- `v`: value to store

**Requires**

Ethernet module has to be initialized. See Ethernet_Init.

**Example**

```c
char data;
...
Ethernet_putByte(data); // put an byte into Ethernet controller's buffer
```

## Ethernet_putBytes

**Prototype**

```c
void Ethernet_putBytes(unsigned char *ptr, unsigned char n);
```

**Returns**

Nothing.

**Description**

This is MAC module routine. It stores requested number of bytes into Ethernet controller's RAM starting from current Ethernet controller's write pointer (EWRPT) location.

Parameters:
- `ptr`: RAM buffer containing bytes to be written into Ethernet controller's RAM.
- `n`: number of bytes to be written.

**Requires**

Ethernet module has to be initialized. See Ethernet_Init.

**Example**

```c
char *buffer = "mikroElektronika";
...
Ethernet_putBytes(buffer, 16); // put an RAM array into Ethernet controller's buffer
```
### Ethernet_putConstBytes

**Prototype**

```c
void Ethernet_putConstBytes(const unsigned char *ptr, unsigned char n);
```

**Returns**

Nothing.

**Description**

This is MAC module routine. It stores requested number of const bytes into Ethernet controller's RAM starting from current Ethernet controller's write pointer (EWRPT) location.

**Parameters:**

- `ptr`: const buffer containing bytes to be written into Ethernet controller's RAM.
- `n`: number of bytes to be written.

**Requires**

Ethernet module has to be initialized. See Ethernet_Init.

**Example**

```c
const char *buffer = "mikroElektronika";
...
Ethernet_putConstBytes(buffer, 16); // put a const array into Ethernet controller's buffer
```

### Ethernet_putString

**Prototype**

```c
unsigned int Ethernet_putString(unsigned char *ptr);
```

**Returns**

Number of bytes written into Ethernet controller's RAM.

**Description**

This is MAC module routine. It stores whole string (excluding null termination) into Ethernet controller's RAM starting from current Ethernet controller's write pointer (EWRPT) location.

**Parameters:**

- `ptr`: string to be written into Ethernet controller's RAM.

**Requires**

Ethernet module has to be initialized. See Ethernet_Init.

**Example**

```c
char *buffer = "mikroElektronika";
...
Ethernet_putString(buffer); // put a RAM string into Ethernet controller's buffer
```
### Ethernet_putConstString

**Prototype**

```c
unsigned int Ethernet_putConstString(const unsigned char *ptr);
```

**Returns**

Number of bytes written into Ethernet controller's RAM.

**Description**

This is MAC module routine. It stores whole const string (excluding null termination) into Ethernet controller's RAM starting from current Ethernet controller's write pointer (EWRPT) location.

**Parameters:**

- `ptr`: const string to be written into Ethernet controller's RAM.

**Requires**

Ethernet module has to be initialized. See Ethernet_Init.

**Example**

```c
const char *buffer = "mikroElektronika";
...
Ethernet_putConstString(buffer); // put a const string into Ethernet controller's buffer
```

### Ethernet_getByte

**Prototype**

```c
unsigned char Ethernet_getByte();
```

**Returns**

Byte read from Ethernet controller's RAM.

**Description**

This is MAC module routine. It fetches a byte from address pointed to by current Ethernet controller's read pointer (ERDPT).

**Requires**

Ethernet module has to be initialized. See Ethernet_Init.

**Example**

```c
char buffer;
...
buffer = Ethernet_getByte(); // read a byte from Ethernet controller's buffer
```

### Ethernet_getBytes

**Prototype**

```c
void Ethernet_getBytes(unsigned char *ptr, unsigned int addr, unsigned char n);
```

**Returns**

Nothing.

**Description**

This is MAC module routine. It fetches equested number of bytes from Ethernet controller's RAM starting from given address. If value of 0xFFFF is passed as the address parameter, the reading will start from current Ethernet controller's read pointer (ERDPT) location.

**Parameters:**

- `ptr`: buffer for storing bytes read from Ethernet controller's RAM.
- `addr`: Ethernet controller's RAM start address. Valid values: 0..8192.
- `n`: number of bytes to be read.

**Requires**

Ethernet module has to be initialized. See Ethernet_Init.

**Example**

```c
char buffer[16];
...
Ethernet_getBytes(buffer, 0x100, 16); // read 16 bytes, starting from address 0x100
```
### Ethernet_UserTCP

**Prototype**

```c
unsigned int Ethernet_UserTCP(unsigned char *remoteHost, unsigned int remotePort, unsigned int localPort, unsigned int reqLength);
```

**Returns**

- 0 - there should not be a reply to the request.
- Length of TCP/HTTP reply data field - otherwise.

**Description**

This is TCP module routine. It is internally called by the library. The user accesses to the TCP/HTTP request by using some of the Ethernet_get routines. The user puts data in the transmit buffer by using some of the Ethernet_put routines. The function must return the length in bytes of the TCP/HTTP reply, or 0 if there is nothing to transmit. If there is no need to reply to the TCP/HTTP requests, just define this function with return(0) as a single statement.

**Parameters:**

- `remoteHost`: client's IP address.
- `remotePort`: client's TCP port.
- `localPort`: port to which the request is sent.
- `reqLength`: TCP/HTTP request data field length.

**Note:** The function source code is provided with appropriate example projects. The code should be adjusted by the user to achieve desired reply.

**Requires**

Ethernet module has to be initialized. See Ethernet_Init.

**Example**

This function is internally called by the library and should not be called by the user's code.
### Ethernet_UserUDP

**Prototype**

```c
unsigned int Ethernet_UserUDP(unsigned char *remoteHost, unsigned int remotePort, unsigned int destPort, unsigned int reqLength);
```

**Returns**

- 0: there should not be a reply to the request.
- Length of UDP reply data field: otherwise.

**Description**

This is UDP module routine. It is internally called by the library. The user accesses to the UDP request by using some of the Ethernet_get routines. The user puts data in the transmit buffer by using some of the Ethernet_put routines. The function must return the length in bytes of the UDP reply, or 0 if nothing to transmit. If you don't need to reply to the UDP requests, just define this function with a return(0) as single statement.

**Parameters:**

- `remoteHost`: client's IP address.
- `remotePort`: client's port.
- `destPort`: port to which the request is sent.
- `reqLength`: UDP request data field length.

**Note:** The function source code is provided with appropriate example projects. The code should be adjusted by the user to achieve desired reply.

**Requires**

Ethernet module has to be initialized. See Ethernet_Init.

**Example**

This function is internally called by the library and should not be called by the user's code.

### Ethernet_getIpAddress

**Prototype**

```c
unsigned char * Ethernet_getIpAddress();
```

**Returns**

Pointer to the global variable holding IP address.

**Description**

This routine should be used when DHCP server is present on the network to fetch assigned IP address.

**Note:** User should always copy the IP address from the RAM location returned by this routine into it's own IP address buffer. These locations should not be altered by the user in any case!

**Requires**

Ethernet module has to be initialized. See Ethernet_Init.

**Example**

```c
unsigned char ipAddr[4]; // user IP address buffer
...
memcpy(ipAddr, Ethernet_getIpAddress(), 4); // fetch IP address
```
## Ethernet_getGwIpAddress

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned char * Ethernet_getGwIpAddress();</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Pointer to the global variable holding gateway IP address.</td>
</tr>
<tr>
<td>Description</td>
<td>This routine should be used when DHCP server is present on the network to fetch assigned gateway IP address. <strong>Note:</strong> User should always copy the IP address from the RAM location returned by this routine into its own gateway IP address buffer. These locations should not be altered by the user in any case!</td>
</tr>
<tr>
<td>Requires</td>
<td>Ethernet module has to be initialized. See Ethernet_Init.</td>
</tr>
</tbody>
</table>
| Example       | `unsigned char gwIpAddr[4]; // user gateway IP address buffer  
...  
memcpy(gwIpAddr, Ethernet_getGwIpAddress(), 4); // fetch gateway IP address` |

## Ethernet_getDnsIpAddress

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned char * Ethernet_getDnsIpAddress</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Pointer to the global variable holding DNS IP address.</td>
</tr>
<tr>
<td>Description</td>
<td>This routine should be used when DHCP server is present on the network to fetch assigned DNS IP address. <strong>Note:</strong> User should always copy the IP address from the RAM location returned by this routine into its own DNS IP address buffer. These locations should not be altered by the user in any case!</td>
</tr>
<tr>
<td>Requires</td>
<td>Ethernet module has to be initialized. See Ethernet_Init.</td>
</tr>
</tbody>
</table>
| Example       | `unsigned char dnsIpAddr[4]; // user DNS IP address buffer  
...  
memcpy(dnsIpAddr, Ethernet_getDnsIpAddress(), 4); // fetch DNS server address` |
### Ethernet_getIpMask

**Prototype**

```c
unsigned char * Ethernet_getIpMask()
```

**Returns**

Pointer to the global variable holding IP subnet mask.

**Description**

This routine should be used when DHCP server is present on the network to fetch assigned IP subnet mask.

**Note**: User should always copy the IP address from the RAM location returned by this routine into it's own IP subnet mask buffer. These locations should not be altered by the user in any case!

**Requires**

Ethernet module has to be initialized. See Ethernet_Init.

**Example**

```c
unsigned char IpMask[4]; // user IP subnet mask buffer
...
memcpy(IpMask, Ethernet_getIpMask(), 4); // fetch IP subnet mask
```

### Ethernet_confNetwork

**Prototype**

```c
void Ethernet_confNetwork(char *ipMask, char *gwIpAddr, char *dnsIpAddr);
```

**Returns**

Nothing.

**Description**

Configures network parameters (IP subnet mask, gateway IP address, DNS IP address) when DHCP is not used.

**Parameters:**

- `ipMask`: IP subnet mask.
- `gwIpAddr`: gateway IP address.
- `dnsIpAddr`: DNS IP address.

**Note**: The above mentioned network parameters should be set by this routine only if DHCP module is not used. Otherwise DHCP will override these settings.

**Requires**

Ethernet module has to be initialized. See Ethernet_Init.

**Example**

```c
unsigned char ipMask[4] = {255, 255, 255, 0}; // network mask (for example : 255.255.255.0)
unsigned char gwIpAddr[4] = {192, 168, 1, 1}; // gateway (router) IP address
unsigned char dnsIpAddr[4] = {192, 168, 1, 1}; // DNS server IP address
...
Ethernet_confNetwork(ipMask, gwIpAddr, dnsIpAddr); // set network configuration parameters
```
### Ethernet_arpResolve

**Prototype**

```c
unsigned char *Ethernet_arpResolve(unsigned char *ip, unsigned char tmax);
```

**Returns**

- MAC address behind the IP address - the requested IP address was resolved.
- 0 - otherwise.

**Description**

This is ARP module routine. It sends an ARP request for given IP address and waits for ARP reply. If the requested IP address was resolved, an ARP cash entry is used for storing the configuration. ARP cash can store up to 3 entries. For ARP cash structure refer to "eth_j60LibDef.h" header file in the compiler's Uses/P18 folder.

**Parameters:**

- `ip`: IP address to be resolved.
- `tmax`: time in seconds to wait for an reply.

**Note:** The Ethernet services are not stopped while this routine waits for ARP reply. The incoming packets will be processed normaly during this time.

**Requires**

Ethernet module has to be initialized. See Ethernet_Init.

**Example**

```c
unsigned char IpAddr[4] = {192, 168, 1, 1}; // IP address
...
Ethernet_arpResolve(IpAddr, 5); // get MAC address behind the above IP address, wait 5 secs for the response
```

### Ethernet_sendUDP

**Prototype**

```c
unsigned char Ethernet_sendUDP(unsigned char *destIP, unsigned int sourcePort, unsigned int destPort, unsigned char *pkt, unsigned int pktLen);
```

**Returns**

- 1 - UDP packet was sent successfully.
- 0 - otherwise.

**Description**

This is UDP module routine. It sends an UDP packet on the network.

**Parameters:**

- `destIP`: remote host IP address.
- `sourcePort`: local UDP source port number.
- `destPort`: destination UDP port number.
- `pkt`: packet to transmit.
- `pktLen`: length in bytes of packet to transmit.

**Requires**

Ethernet module has to be initialized. See Ethernet_Init.

**Example**

```c
unsigned char IpAddr[4] = {192, 168, 1, 1}; // remote IP address
...
Ethernet_sendUDP(IpAddr, 10001, 10001, "Hello", 5); // send Hello message to the above IP address, from UDP port 10001 to UDP port 10001
```
**Ethernet_dnsResolve**

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned char *Ethernet_dnsResolve(unsigned char *host, unsigned char tmax);</code></th>
</tr>
</thead>
</table>
| Returns     | - pointer to the location holding the IP address - the requested host name was resolved.  
- 0 - otherwise. |
| Description | This is DNS module routine. It sends an DNS request for given host name and waits for DNS reply. If the requested host name was resolved, it's IP address is stored in library global variable and a pointer containing this address is returned by the routine. UDP port 53 is used as DNS port. |
| Parameters: | - host: host name to be resolved.  
- tmax: time in seconds to wait for an reply. |
| Note:       | The Ethernet services are not stopped while this routine waits for DNS reply. The incoming packets will be processed normally during this time. |
| Notes:      | User should always copy the IP address from the RAM location returned by this routine into it's own resolved host IP address buffer. These locations should not be altered by the user in any case! |
| Requires    | Ethernet module has to be initialized. See Ethernet_Init. |
| Example     | `unsigned char * remoteHostIpAddr[4]; // user host IP address buffer  
...  
// SNTP server:  
// Zurich, Switzerland: Integrated Systems Lab, Swiss Fed. Inst. of Technology  
// 129.132.2.21: swisstime.ethz.ch  
// Service Area: Switzerland and Europe  
memcpy(remoteHostIpAddr, Ethernet_dnsResolve("swisstime.ethz.ch", 5), 4);` |
### Ethernet_initDHCP

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned char Ethernet_initDHCP(unsigned char tmax);</code></th>
</tr>
</thead>
</table>
| Returns    | - 1 - network parameters were obtained successfully.  
- 0 - otherwise. |
| Description| This is DHCP module routine. It sends an DHCP request for network parameters (IP, gateway, DNS addresses and IP subnet mask) and waits for DHCP reply. If the requested parameters were obtained successfully, their values are stored into the library global variables.

These parameters can be fetched by using appropriate library IP get routines:

- `Ethernet_getIpAddress` - fetch IP address.
- `Ethernet_getGwIpAddress` - fetch gateway IP address.
- `Ethernet_getDnsIpAddress` - fetch DNS IP address.
- `Ethernet_getIpMask` - fetch IP subnet mask.

UDP port 68 is used as DHCP client port and UDP port 67 is used as DHCP server port.

Parameters:

- `tmax`: time in seconds to wait for an reply.

**Note:** The Ethernet services are not stopped while this routine waits for DNS reply. The incoming packets will be processed normally during this time.

**Note:** When DHCP module is used, global library variable `Ethernet_userTimerSec` is used to keep track of time. It is user responsibility to increment this variable each second in it's code.

<table>
<thead>
<tr>
<th>Requires</th>
<th>Ethernet module has to be initialized. See Ethernet_Init.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example</td>
<td><code>... Ethernet_initDHCP(5); // get network configuration from DHCP server, wait 5 sec for the response ...</code></td>
</tr>
</tbody>
</table>
### Ethernet_doDHCPLeaseTime

**Prototype**

```c
unsigned char Ethernet_doDHCPLeaseTime();
```

**Returns**

- 0 - lease time has not expired yet.
- 1 - lease time has expired, it's time to renew it.

**Description**

This is DHCP module routine. It takes care of IP address lease time by decrementing the global lease time library counter. When this time expires, it's time to contact DHCP server and renew the lease.

**Requires**

Ethernet module has to be initialized. See Ethernet_Init.

**Example**

```c
while(1) {
    ...
    if (Ethernet_doDHCPLeaseTime())
        ... // it's time to renew the IP address lease
}
```

### Ethernet_renewDHCP

**Prototype**

```c
unsigned char Ethernet_renewDHCP(unsigned char tmax);
```

**Returns**

- 0 - upon success (lease time was renewed).
- 1 - otherwise (renewal request timed out).

**Description**

This is DHCP module routine. It sends IP address lease time renewal request to DHCP server.

**Parameters:**

- `tmax`: time in seconds to wait for an reply.

**Requires**

Ethernet module has to be initialized. See Ethernet_Init.

**Example**

```c
while(1) {
    ...
    if (Ethernet_doDHCPLeaseTime())
        Ethernet_renewDHCP(5); // it's time to renew the IP address lease, with 5 secs for a reply
    ...
}
```
Library Example

This code shows how to use the PIC18FxxJ60 Ethernet library:

- the board will reply to ARP & ICMP echo requests
- the board will reply to UDP requests on any port:
  returns the request in upper char with a header made of remote host IP &
  port number
- the board will reply to HTTP requests on port 80, GET method with pathnames:
  / will return the HTML main page
  /s will return board status as text string
  /t0 ... /t7 will toggle RD0 to RD7 bit and return HTML main page
  all other requests return also HTML main page.

#define _Ethernet_HALFDUPLEX 0
#define Ethernet_FULLDUPLEX 1

}
FLASH MEMORY LIBRARY

This library provides routines for accessing microcontroller Flash memory. Note that prototypes differ for PIC16 and PIC18 families.

Note: Due to the P16/P18 family flash specifics, flash library is MCU dependent. Since the P18 family differ significantly in number of bytes that can be erased and/or written to specific MCUs, the appropriate suffix is added to the names of functions in order to make it easier to use them. Flash memory operations are MCU dependent:

1. **Read** operation supported. For this group of MCU's only read function is implemented.
2. **Read** and **Write** operations supported (write is executed as erase-and-write). For this group of MCU’s read and write functions are implemented. Note that write operation which is executed as erase-and-write, may write less bytes than it erases.
3. **Read**, **Write** and **Erase** operations supported. For this group of MCU’s read, write and erase functions are implemented. Furthermore, flash memory block has to be erased prior to writing (write operation is not executed as erase-and-write).

Please refer to MCU datasheet before using flash library.

Library Routines

- FLASH_Read
- FLASH_Read_N_Bytes
- FLASH_Write
- FLASH_Write_8
- FLASH_Write_16
- FLASH_Write_32
- FLASH_Write_64
- FLASH_Erase
- FLASH_Erase_64
- FLASH_Erase_1024
- FLASH_Erase_Write
- FLASH_Erase_Write_64
- FLASH_Erase_Write_1024
### FLASH_Read

| Prototype          | // for PIC16  
|                   | unsigned FLASH_Read(unsigned address);  
|                   | // for PIC18  
|                   | unsigned short FLASH_Read(long address);  
| Returns           | Returns data byte from Flash memory.  
| Description       | Reads data from the specified address in Flash memory.  
| Requires          | Nothing.  
| Example           | // for PIC18  
|                   | unsigned short tmp;  
|                   | ...  
|                   | tmp = FLASH_Read(0x0D00);  
|                   | ... |

### FLASH_Read_N_Byes

| Prototype          | void FLASH_Read_N_Bytes(long address, char* data_, unsigned int N);  
| Returns            | Nothing.  
| Description        | Reads N data from the specified address in Flash memory to variable pointed by data.  
| Requires           | Nothing.  
| Example            | FLASH_Read_N(0x0D00,data_buffer,sizeof(data_buffer));  

**FLASH_Write**

<table>
<thead>
<tr>
<th>Prototype</th>
<th>Returns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>// for PIC16</td>
<td></td>
<td>Writes block of data to Flash memory. Block size is MCU dependent.</td>
</tr>
<tr>
<td>void FLASH_Write(unsigned address, unsigned int* data);</td>
<td></td>
<td>P16: This function may erase memory segment before writing block of data to it (MCU dependent). Furthermore, memory segment which will be erased may be greater than the size of the data block that will be written (MCU dependent). Therefore it is recommended to write as many bytes as you erase. FLASH_Write writes 4 flash memory locations in a row, so it needs to be called as many times as it is necessary to meet the size of the data block that will be written.</td>
</tr>
<tr>
<td>// for PIC18</td>
<td></td>
<td>P18: This function does not perform erase prior to write.</td>
</tr>
<tr>
<td>void FLASH_Write_8(long address, char* data);</td>
<td></td>
<td>Requires Flash memory that will be written may have to be erased before this function is called (MCU dependent). Refer to MCU datasheet for details.</td>
</tr>
<tr>
<td>void FLASH_Write_16(long address, char* data);</td>
<td></td>
<td>Example Write consecutive values in 64 consecutive locations, starting from 0x0D00:</td>
</tr>
<tr>
<td>void FLASH_Write_32(long address, char* data);</td>
<td></td>
<td></td>
</tr>
<tr>
<td>void FLASH_Write_64(long address, char* data);</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Returns Nothing.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Example

```c
unsigned short toWrite[64];
...  
// initialize array:
for (i = 0; i < 64; i++)
    toWrite[i] = i;

// write contents of the array to the address 0x0D00:
FLASH_Write_64(0x0D00, toWrite);
```
### FLASH_Erase

**Prototype**

// for PIC16  
void FLASH_Erase(unsigned address);  
// for PIC18  
void FLASH_Erase_64(long address);  
void FLASH_Erase_1024(long address);

**Returns**
Nothing.

**Description**
Erases memory block starting from a given address. For P16 family is implemented only for those MCU's whose flash memory does not support erase-and-write operations (refer to datasheet for details).

**Requires**
Nothing.

**Example**
Erase 64 byte memory memory block, starting from address 0x0D00:
FLASH_Erase_64(0x0D00);

### FLASH_Erase_Write

**Prototype**

// for PIC18  
void FLASH_Erase_Write_64(long address, char* data);

void FLASH_Erase_Write_1024(long address, char* data);

**Returns**
None.

**Description**
Erase then write memory block starting from a given address.

**Requires**
Nothing.

**Example**
```c
char toWrite[64];  
int i;  
...  
// initialize array:  
for(i=0; i<64; i++) toWrite[i]=i;

// erase block of memory at address 0x0D00 then write contents of the array to the address 0x0D00:  
FLASH_Erase_Write_64(0x0D00, toWrite);
```
Library Example

The example demonstrates simple write to the flash memory for PIC16F887, then reads the data and displays it on PORTB and PORTC.

```c
char i = 0;
unsigned int addr, data_, dataAR[4][4] = {{ 0x3FAA+0, 0x3FAA+1,
0x3FAA+2, 0x3FAA+3},
{ 0x3FAA+4, 0x3FAA+5,
0x3FAA+6, 0x3FAA+7},
{ 0x3FAA+8, 0x3FAA+9,
0x3FAA+10, 0x3FAA+11},
{0x3FAA+12, 0x3FAA+13,
0x3FAA+14, 0x3FAA+15}};

void main() {
  ANSEL  = 0;               // Configure AN pins as digital I/O
  ANSELH = 0;
  PORTB = 0;                          // Initial PORTB value
  TRISB = 0;                          // Set PORTB as output
  PORTC = 0;                          // Initial PORTC value
  TRISC = 0;                          // Set PORTC as output
  Delay_ms(500);

  // All block writes
  // to program memory are done as 16-word erase by
  // eight-word write operations. The write operation is
  // edge-aligned and cannot occur across boundaries.
  // Therefore it is recommended to perform flash writes in 16-word
  // chunks.
  // That is why lower 4 bits of start address [3:0] must be zero.
  // Since FLASH_Write routine performs writes in 4-word chunks,
  // we need to call it 4 times in a row.
  addr = 0x0430;    // starting Flash address, valid for P16F887
  for (i = 0; i < 4; i++){     // Write some data to Flash
    Delay_ms(100);
    FLASH_Write(addr+i*4, dataAR[i]);
  }
  Delay_ms(500);

  addr = 0x0430;
  for (i = 0; i < 16; i++){
    data_ = FLASH_Read(addr++);  // P16's FLASH is 14-bit wide, so
    Delay_us(10);                // two MSB's will always be '00'
    PORTB = data_;               // Display data on PORTB LS Byte
    PORTC = data_ >> 8;          // and PORTC MS Byte
    Delay_ms(500);
  }
}
```
**GRAPHIC LCD LIBRARY**

The *mikroC PRO for PIC* provides a library for operating Graphic Lcd 128x64 (with commonly used Samsung KS108/KS107 controller).

For creating a custom set of Glcd images use Glcd Bitmap Editor Tool.

**External dependencies of Graphic LCD Library**

<table>
<thead>

Library Routines

Basic routines:

- Glcd_Init
- Glcd_Set_Side
- Glcd_Set_X
- Glcd_Set_Page
- Glcd_Read_Data
- Glcd_Write_Data

Advanced routines:

- Glcd_Fill
- Glcd_Dot
- Glcd_Line
- Glcd_V_Line
- Glcd_H_Line
- Glcd_Rectangle
- Glcd_Box
- Glcd_Circle
- Glcd_Set_Font
- Glcd_Write_Char
- Glcd_Write_Text
- Glcd_Image
# Glcd_Init

**Prototype**

```c
void Glcd_Init();
```

**Returns**

Nothing.

**Description**

Initializes the Glcd module. Each of the control lines is both port and pin configurable, while data lines must be on a single port (pins <0:7>).

**Requires**

Global variables:

- `GLCD_CS1`: Chip select 1 signal pin
- `GLCD_CS2`: Chip select 2 signal pin
- `GLCD_RS`: Register select signal pin
- `GLCD_RW`: Read/Write Signal pin
- `GLCD_EN`: Enable signal pin
- `GLCD_RST`: Reset signal pin
- `GLCD_DataPort`: Data port
- `GLCD_CS1_Direction`: Direction of the Chip select 1 pin
- `GLCD_CS2_Direction`: Direction of the Chip select 2 pin
- `GLCD_RS_Direction`: Direction of the Register select signal pin
- `GLCD_RW_Direction`: Direction of the Read/Write signal pin
- `GLCD_EN_Direction`: Direction of the Enable signal pin
- `GLCD_RST_Direction`: Direction of the Reset signal pin

... must be defined before using this function.

**Example**

```c
// glcd pinout settings
char GLCD_DataPort at PORTD;

sbit GLCD_CS1 at RB0_bit;
sbit GLCD_CS2 at RB1_bit;
sbit GLCD_RS at RB2_bit;
sbit GLCD_RW at RB3_bit;
sbit GLCD_EN at RB4_bit;
sbit GLCD_RST at RB5_bit;

sbit GLCD_CS1_Direction at TRISB0_bit;
sbit GLCD_CS2_Direction at TRISB1_bit;
sbit GLCD_RS_Direction at TRISB2_bit;
sbit GLCD_RW_Direction at TRISB3_bit;
sbit GLCD_EN_Direction at TRISB4_bit;
sbit GLCD_RST_Direction at TRISB5_bit;
...
ANSEL = 0;
ANSELH = 0;
Glcd_Init();
```
## Glcd_Set.Side

**Prototype**  
```c
void Glcd_Set.Side(unsigned short x_pos);
```

**Returns**  
Nothing.

**Description**  
Selects Glcd side. Refer to the Glcd datasheet for detailed explanation.

**Parameters:**
- `x_pos`: position on x-axis. Valid values: 0..127

The parameter `x_pos` specifies the Glcd side: values from 0 to 63 specify the left side, values from 64 to 127 specify the right side.

**Note:** For side, x axis and page layout explanation see schematic at the bottom of this page.

**Requires**  
Glcd needs to be initialized, see Glcd_Init routine.

**Example**  
The following two lines are equivalent, and both of them select the left side of Glcd:

```c
Glcd.Select.Side(0);
Glcd.Select.Side(10);
```

## Glcd.Set.X

**Prototype**  
```c
void Glcd.Set.X(unsigned short x_pos);
```

**Returns**  
Nothing.

**Description**  
Sets x-axis position to `x_pos` dots from the left border of Glcd within the selected side.

**Parameters:**
- `x_pos`: position on x-axis. Valid values: 0..63

**Note:** For side, x axis and page layout explanation see schematic at the bottom of this page.

**Requires**  
Glcd needs to be initialized, see Glcd_Init routine.

**Example**  
```c
Glcd.Set.X(25);
```
### Glcd_Set_Page

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void Glcd_Set_Page(unsigned short page);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Selects page of the Glcd.</td>
</tr>
<tr>
<td>Parameters:</td>
<td>- <code>page</code>: page number. Valid values: 0..7</td>
</tr>
<tr>
<td>Note:</td>
<td>For side, x axis and page layout explanation see schematic at the bottom of this page.</td>
</tr>
<tr>
<td>Requires</td>
<td>GLCD needs to be initialized, see Glcd_Init routine.</td>
</tr>
<tr>
<td>Example</td>
<td><code>Glcd_Set_Page(5);</code></td>
</tr>
</tbody>
</table>

### Glcd_Read_Data

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned short Glcd_Read_Data();</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>One byte from GLCD memory.</td>
</tr>
<tr>
<td>Description</td>
<td>Reads data from from the current location of Glcd memory and moves to the next location.</td>
</tr>
<tr>
<td>Requires</td>
<td>Glcd needs to be initialized, see Glcd_Init routine.</td>
</tr>
<tr>
<td></td>
<td>Glcd side, x-axis position and page should be set first. See functions Glcd_Set_Side, Glcd_Set_X, and Glcd_Set_Page.</td>
</tr>
<tr>
<td>Example</td>
<td><code>unsigned short data;</code></td>
</tr>
<tr>
<td></td>
<td><code>...</code></td>
</tr>
<tr>
<td></td>
<td><code>data = Glcd_Read_Data();</code></td>
</tr>
</tbody>
</table>
### Glcd_Write_Data

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void Glcd_Write_Data(unsigned short ddata);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Writes one byte to the current location in Glcd memory and moves to the next location.</td>
</tr>
<tr>
<td>Parameters:</td>
<td></td>
</tr>
<tr>
<td>- <code>ddata</code>: data to be written</td>
<td></td>
</tr>
<tr>
<td>Requires</td>
<td>Glcd needs to be initialized, see Glcd_Init routine.</td>
</tr>
<tr>
<td></td>
<td>Glcd side, x-axis position and page should be set first. See functions Glcd_Set_Side, Glcd_Set_X, and Glcd_Set_Page.</td>
</tr>
<tr>
<td>Example</td>
<td><code>unsigned short data;</code></td>
</tr>
<tr>
<td></td>
<td><code>...</code></td>
</tr>
<tr>
<td></td>
<td><code>Glcd_Write_Data(data);</code></td>
</tr>
</tbody>
</table>

### Glcd_Fill

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void Glcd_Fill(unsigned short pattern);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Fills Glcd memory with the byte pattern.</td>
</tr>
<tr>
<td>Parameters:</td>
<td></td>
</tr>
<tr>
<td>- <code>pattern</code>: byte to fill Glcd memory with</td>
<td></td>
</tr>
<tr>
<td>Requires</td>
<td>Glcd needs to be initialized, see Glcd_Init routine.</td>
</tr>
<tr>
<td>Example</td>
<td><code>// Clear screen</code></td>
</tr>
<tr>
<td></td>
<td><code>Glcd_Fill(0);</code></td>
</tr>
</tbody>
</table>
### Glcd_Dot

**Prototype**

```c
void Glcd_Dot(unsigned short x_pos, unsigned short y_pos, unsigned short color);
```

**Returns**

Nothing.

**Description**

Draws a dot on Glcd at coordinates (x_pos, y_pos).

**Parameters:**

- `x_pos`: x position. Valid values: 0..127
- `y_pos`: y position. Valid values: 0..63
- `color`: color parameter. Valid values: 0..2

The parameter `color` determines a dot state: 0 clears dot, 1 puts a dot, and 2 inverts dot state.

**Note:** For x and y axis layout explanation see schematic at the bottom of this page.

**Requires**

Glcd needs to be initialized, see Glcd_Init routine.

**Example**

```c
// Invert the dot in the upper left corner
Glcd_Dot(0, 0, 2);
```

### Glcd_Line

**Prototype**

```c
void Glcd_Line(int x_start, int y_start, int x_end, int y_end, unsigned short color);
```

**Returns**

Nothing.

**Description**

Draws a line on Glcd.

**Parameters:**

- `x_start`: x coordinate of the line start. Valid values: 0..127
- `y_start`: y coordinate of the line start. Valid values: 0..63
- `x_end`: x coordinate of the line end. Valid values: 0..127
- `y_end`: y coordinate of the line end. Valid values: 0..63
- `color`: color parameter. Valid values: 0..2

The parameter `color` determines the line color: 0 white, 1 black, and 2 inverts each dot.

**Requires**

Glcd needs to be initialized, see Glcd_Init routine.

**Example**

```c
// Draw a line between dots (0,0) and (20,30)
Glcd_Line(0, 0, 20, 30, 1);
```
### Glcd_V_Line

**Prototype**

```c
void Glcd_V_Line(unsigned short y_start, unsigned short y_end, unsigned short x_pos, unsigned short color);
```

**Returns**

Nothing.

**Description**

Draws a vertical line on Glcd.

Parameters:

- `y_start`: y coordinate of the line start. Valid values: 0..63
- `y_end`: y coordinate of the line end. Valid values: 0..63
- `x_pos`: x coordinate of vertical line. Valid values: 0..127
- `color`: color parameter. Valid values: 0..2

The parameter `color` determines the line color: 0 white, 1 black, and 2 inverts each dot.

**Requires**

Glcd needs to be initialized, see Glcd_Init routine.

**Example**

```c
// Draw a vertical line between dots (10,5) and (10,25)
Glcd_V_Line(5, 25, 10, 1);
```

### Glcd_H_Line

**Prototype**

```c
void Glcd_H_Line(unsigned short x_start, unsigned short x_end, unsigned short y_pos, unsigned short color);
```

**Returns**

Nothing.

**Description**

Draws a horizontal line on Glcd.

Parameters:

- `x_start`: x coordinate of the line start. Valid values: 0..127
- `x_end`: x coordinate of the line end. Valid values: 0..127
- `y_pos`: y coordinate of horizontal line. Valid values: 0..63
- `color`: color parameter. Valid values: 0..2

The parameter `color` determines the line color: 0 white, 1 black, and 2 inverts each dot.

**Requires**

Glcd needs to be initialized, see Glcd_Init routine.

**Example**

```c
// Draw a horizontal line between dots (10,20) and (50,20)
Glcd_H_Line(10, 50, 20, 1);
```
### Glcd_Rectangle

**Prototype**

```c
void Glcd_Rectangle(unsigned short x_upper_left, unsigned short y_upper_left, unsigned short x_bottom_right, unsigned short y_bottom_right, unsigned short color);
```

**Returns**

Nothing.

**Description**

Draws a rectangle on GLCD.

Parameters:

- `x_upper_left`: x coordinate of the upper left rectangle corner. Valid values: 0..127
- `y_upper_left`: y coordinate of the upper left rectangle corner. Valid values: 0..63
- `x_bottom_right`: x coordinate of the lower right rectangle corner. Valid values: 0..127
- `y_bottom_right`: y coordinate of the lower right rectangle corner. Valid values: 0..63
- `color`: color parameter. Valid values: 0..2

The parameter `color` determines the color of the rectangle border: 0 white, 1 black, and 2 inverts each dot.

**Requires**

GLCD needs to be initialized, see `Glcd_Init` routine.

**Example**

```
// Draw a rectangle between dots (5,5) and (40,40)
Glcd_Rectangle(5, 5, 40, 40, 1);
```

### Glcd_Box

**Prototype**

```c
void Glcd_Box(unsigned short x_upper_left, unsigned short y_upper_left, unsigned short x_bottom_right, unsigned short y_bottom_right, unsigned short color);
```

**Returns**

Nothing.

**Description**

Draws a box on GLCD.

Parameters:

- `x_upper_left`: x coordinate of the upper left box corner. Valid values: 0..127
- `y_upper_left`: y coordinate of the upper left box corner. Valid values: 0..63
- `x_bottom_right`: x coordinate of the lower right box corner. Valid values: 0..127
- `y_bottom_right`: y coordinate of the lower right box corner. Valid values: 0..63
- `color`: color parameter. Valid values: 0..2

The parameter `color` determines the color of the box fill: 0 white, 1 black, and 2 inverts each dot.

**Requires**

GLCD needs to be initialized, see `Glcd_Init` routine.

**Example**

```
// Draw a box between dots (5,15) and (20,40)
Glcd_Box(5, 15, 20, 40, 1);
```
**Glcd_Circle**

**Prototype**

```c
void Glcd_Circle(int x_center, int y_center, int radius, unsigned short color);
```

**Returns**

Nothing.

**Description**

Draws a circle on GLCD.

Parameters:

- `x_center`: x coordinate of the circle center. Valid values: 0..127
- `y_center`: y coordinate of the circle center. Valid values: 0..63
- `radius`: radius size
- `color`: color parameter. Valid values: 0..2

The parameter `color` determines the color of the circle line: 0 white, 1 black, and 2 inverts each dot.

**Requires**

GLCD needs to be initialized, see Glcd_Init routine.

**Example**

```c
// Draw a circle with center in (50,50) and radius=10
Glcd_Circle(50, 50, 10, 1);
```

**Glcd_Set_Font**

**Prototype**

```c
void Glcd_Set_Font(const char *activeFont, unsigned short aFontWidth, unsigned short aFontHeight, unsigned int aFontOffs);
```

**Returns**

Nothing.

**Description**

Sets font that will be used with Glcd_Write_Char and Glcd_Write_Text routines.

Parameters:

- `activeFont`: font to be set. Needs to be formatted as an array of byte
- `aFontWidth`: width of the font characters in dots.
- `aFontHeight`: height of the font characters in dots.
- `aFontOffs`: number that represents difference between the mikroC PRO for PIC character set and regular ASCII set (eg. if 'A' is 65 in ASCII character, and 'A' is 45 in the mikroC PRO for PIC character set, aFontOffs is 20). Demo fonts supplied with the library have an offset of 32, which means that they start with space.

The user can use fonts given in the file “__Lib_GLCDFonts” file located in the Uses folder or create his own fonts.

**Requires**

GLCD needs to be initialized, see Glcd_Init routine.

**Example**

```c
// Use the custom 5x7 font "myfont" which starts with space (32):
Glcd_Set_Font(&myfont, 5, 7, 32);
```
### Glcd_Write_Char

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void Glcd_Write_Char(unsigned short chr, unsigned short x_pos, unsigned short page_num, unsigned short color);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
</tbody>
</table>
| Description | Prints character on the GLCD. Parameter:  
- **chr**: character to be written  
- **x_pos**: character starting position on x-axis. Valid values: 0..(127-FontWidth)  
- **page_num**: the number of the page on which character will be written. Valid values: 0..7  
- **color**: color parameter. Valid values: 0..2  

The parameter **color** determines the color of the character: 0 white, 1 black, and 2 inverts each dot.  

**Note:** For x axis and page layout explanation see schematic at the bottom of this page.  

<table>
<thead>
<tr>
<th>Requires</th>
<th>Glcd needs to be initialized, see Glcd_Init routine. Use Glcd_Set_Font to specify the font for display; if no font is specified, then default 5x8 font supplied with the library will be used.</th>
</tr>
</thead>
</table>
| Example  | // Write character 'C' on the position 10 inside the page 2:  
Glcd_Write_Char('C', 10, 2, 1);                                                                 |
**Glcd_Write_Text**

**Prototype**

```c
void Glcd_Write_Text(char *text, unsigned short x_pos, unsigned short page_num, unsigned short color);
```

**Returns**

Nothing.

**Description**

Prints text on GLCD.

Parameters:

- **text**: text to be written
- **x_pos**: text starting position on x-axis.
- **page_num**: the number of the page on which text will be written. Valid values: 0..7
- **color**: color parameter. Valid values: 0..2

The parameter **color** determines the color of the text: 0 white, 1 black, and 2 inverts each dot.

**Note**: For x axis and page layout explanation see schematic at the bottom of this page.

**Requires**

Glcd needs to be initialized, see Glcd_Init routine. Use Glcd_Set_Font to specify the font for display; if no font is specified, then default 5x8 font supplied with the library will be used.

**Example**

```c
// Write text "Hello world!" on the position 10 inside the page 2:
Glcd_Write_Text("Hello world!", 10, 2, 1);
```

---

**Glcd_Image**

**Prototype**

```c
void Glcd_Image(code const unsigned short *image);
```

**Returns**

Nothing.

**Description**

Displays bitmap on GLCD.

Parameters:

- **image**: image to be displayed. Bitmap array must be located in code memory.

Use the *mikroC PRO for PIC* integrated Glcd Bitmap Editor to convert image to a constant array suitable for displaying on Glcd.

**Requires**

Glcd needs to be initialized, see Glcd_Init routine.

**Example**

```c
// Draw image my_image on Glcd
Glcd_Image(my_image);
```
Library Example

The following example demonstrates routines of the Glcd library: initialization, clear(pattern fill), image displaying, drawing lines, circles, boxes and rectangles, text displaying and handling.

//Declarations-------------------------------------------------------
const code char truck_bmp[1024];
//--------------------------------------------------------------end-declarations

// Glcd module connections
char GLCD_DataPort at PORTD;

delay2S();

Glcd_Set_Font(FontSystem5x7_v2, 5, 7, 32); // Change font
someText = "5x7 Font (v2)";
Glcd_Write_Text(someText, 5, 6, 2); // Write string
delay2S();
```

### HW Connection

![Diagram of HW Connection](image)

**mikroC PRO for PIC**

[340] **MIKROELEKTRONIKA - SOFTWARE AND HARDWARE SOLUTIONS FOR EMBEDDED WORLD**
I²C LIBRARY

I²C full master MSSP module is available with a number of PIC MCU models. *mikroC PRO for PIC* provides library which supports the master I²C mode.

**Note:** Some MCUs have multiple I²C modules. In order to use the desired I²C library routine, simply change the number 1 in the prototype with the appropriate module number, i.e. `I2C1_Init(100000);`

### Library Routines

- `I2C1_Init`
- `I2C1_Start`
- `I2C1_Repeated_Start`
- `I2C1_Is_Idle`
- `I2C1_Rd`
- `I2C1_Wr`
- `I2C1_Stop`

#### I2C1_Init

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void I2C1_Init(unsigned long clock);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Initializes I²C with desired <code>clock</code> (refer to device data sheet for correct values in respect with Fosc). Needs to be called before using other functions of I²C Library. You don't need to configure ports manually for using the module; library will take care of the initialization.</td>
</tr>
<tr>
<td>Requires</td>
<td>Library requires MSSP module on PORTB or PORTC.</td>
</tr>
<tr>
<td><strong>Note:</strong> Calculation of the I²C clock value is carried out by the compiler, as it would produce a relatively large code if performed on the library level. Therefore, compiler needs to know the value of the parameter in the compile time. That is why this parameter needs to be a constant, and not a variable.</td>
<td></td>
</tr>
<tr>
<td>Example</td>
<td><code>I2C1_Init(100000);</code></td>
</tr>
</tbody>
</table>
### I2C1_Start

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned short I2C1_Start(void);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>If there is no error, function returns 0.</td>
</tr>
<tr>
<td>Description</td>
<td>Determines if I2C bus is free and issues START signal.</td>
</tr>
<tr>
<td>Requires</td>
<td>I2C must be configured before using this function. See I2C1_Init.</td>
</tr>
<tr>
<td>Example</td>
<td><code>I2C1_Start();</code></td>
</tr>
</tbody>
</table>

### I2C1_Repeated_Start

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void I2C1_Repeated_Start(void);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Issues repeated START signal.</td>
</tr>
<tr>
<td>Requires</td>
<td>I2C must be configured before using this function. See I2C1_Init.</td>
</tr>
<tr>
<td>Example</td>
<td><code>I2C1_Repeated_Start();</code></td>
</tr>
</tbody>
</table>

### I2C1_Is_Idle

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned short I2C1_Is_Idle(void);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Returns 1 if I2C bus is free, otherwise returns 0.</td>
</tr>
<tr>
<td>Description</td>
<td>Tests if I2C bus is free.</td>
</tr>
<tr>
<td>Requires</td>
<td>I2C must be configured before using this function. See I2C1_Init.</td>
</tr>
<tr>
<td>Example</td>
<td><code>if (I2C1_Is_Idle()) {...}</code></td>
</tr>
</tbody>
</table>

### I2C1_Rd

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned short I2C1_Rd(unsigned short ack);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Returns one byte from the slave.</td>
</tr>
<tr>
<td>Description</td>
<td>Reads one byte from the slave, and sends not acknowledge signal if parameter <code>ack</code> is 0, otherwise it sends acknowledge.</td>
</tr>
<tr>
<td>Requires</td>
<td>I2C must be configured before using this function. See I2C1_Init. Also, START signal needs to be issued in order to use this function. See I2C1_Start.</td>
</tr>
<tr>
<td>Example</td>
<td>Read data and send not acknowledge signal:</td>
</tr>
<tr>
<td></td>
<td><code>unsigned short take;</code></td>
</tr>
<tr>
<td></td>
<td><code>...</code></td>
</tr>
<tr>
<td></td>
<td><code>take = I2C1_Rd(0);</code></td>
</tr>
</tbody>
</table>
### I2C1_Wr

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned short I2C1_Wr(unsigned short data_);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Returns 0 if there were no errors.</td>
</tr>
<tr>
<td>Description</td>
<td>Sends data byte (parameter data) via I2C bus.</td>
</tr>
<tr>
<td>Requires</td>
<td>I2C must be configured before using this function. See I2C1_Init. Also, START signal needs to be issued in order to use this function. See I2C1_Start.</td>
</tr>
<tr>
<td>Example</td>
<td><code>I2C1_Write(0xA3);</code></td>
</tr>
</tbody>
</table>

### I2C1_Stop

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void I2C1_Stop(void);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Issues STOP signal.</td>
</tr>
<tr>
<td>Requires</td>
<td>I2C must be configured before using this function. See I2C1_Init.</td>
</tr>
<tr>
<td>Example</td>
<td><code>I2C1_Stop();</code></td>
</tr>
</tbody>
</table>
Library Example

This code demonstrates use of I\(_2\)C library. PIC MCU is connected (SCL, SDA pins) to 24c02 EEPROM. Program sends data to EEPROM (data is written at address 2). Then, we read data via I\(_2\)C from EEPROM and send its value to PORTB, to check if the cycle was successful (see the figure below how to interface 24c02 to PIC).

```c
void main(){
    ANSEL  = 0;          // Configure AN pins as digital I/O
    ANSELH = 0;
    PORTB = 0;
    TRISB = 0;        // Configure PORTB as output

    I2C1_Init(100000);    // initialize I2C communication
    I2C1_Start();         // issue I2C start signal
    I2C1_Wr(0xA2);        // send byte via I2C  (device address + W)
    I2C1_Wr(2);          // send byte (address of EEPROM location)
    I2C1_Wr(0xF0);         // send data (data to be written)
    I2C1_Stop();           // issue I2C stop signal

    Delay_100ms();

    I2C1_Start();          // issue I2C start signal
    I2C1_Wr(0xA2);         // send byte via I2C  (device address + W)
    I2C1_Wr(2);           // send byte (data address)
    I2C1_Repeated_Start();  // issue I2C signal repeated start
    I2C1_Wr(0xA3);         // send byte (device address + R)
    PORTB = I2C1_Rd(0u);   // Read the data (NO acknowledge)
    I2C1_Stop();          // issue I2C stop signal
}
```
Interfacing 24C02 to PIC via I²C
The **mikroC PRO for PIC** provides a library for working with 4x4 keypad. The library routines can also be used with 4x1, 4x2, or 4x3 keypad. For connections explanation see schematic at the bottom of this page.

### External dependencies of Keypad Library

<table>
<thead>
<tr>
<th>The following variable must be defined in all projects using Keypad Library:</th>
<th>Description:</th>
<th>Example:</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>extern sfr char keypadPort;</code></td>
<td>Keypad Port.</td>
<td><code>char keypadPort at PORTD;</code></td>

<tr>
<td></td>
<td><code>...</code></td>
</tr>
<tr>
<td></td>
<td><code>Keypad_Init();</code></td>
</tr>
</tbody>
</table>
### Keypad_Key_Press

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>char Keypad_Key_Press(void);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>The code of a pressed key (1..16). If no key is pressed, returns 0.</td>
</tr>
<tr>
<td>Description</td>
<td>Reads the key from keypad when key gets pressed.</td>
</tr>
<tr>
<td>Requires</td>
<td>Port needs to be initialized for working with the Keypad library, see Keypad_Init.</td>
</tr>
</tbody>
</table>
| Example   | `char kp;`  
`...`  
`kp = Keypad_Key_Press();` |

### Keypad_Key_Click

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>char Keypad_Key_Click(void);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>The code of a clicked key (1..16). If no key is clicked, returns 0.</td>
</tr>
<tr>
<td>Description</td>
<td>Call to <code>Keypad_Key_Click</code> is a blocking call: the function waits until some key is pressed and released. When released, the function returns 1 to 16, depending on the key. If more than one key is pressed simultaneously the function will wait until all pressed keys are released. After that the function will return the code of the first pressed key.</td>
</tr>
<tr>
<td>Requires</td>
<td>Port needs to be initialized for working with the Keypad library, see Keypad_Init.</td>
</tr>
</tbody>
</table>
| Example   | `char kp;`  
`...`  
`kp = Keypad_Key_Click();` |
Library Example

This is a simple example of using the Keypad Library. It supports keypads with 1..4 rows and 1..4 columns. The code being returned by Keypad_Key_Click() function is in range from 1..16. In this example, the code returned is transformed into ASCII codes [0..9,A..F] and displayed on LCD. In addition, a small single-byte counter displays in the second LCD row number of key presses.

```c
unsigned short kp, cnt, oldstate = 0;
char txt[6];

// Keypad module connections
char keypadPort at PORTD;
// End Keypad module connections

// LCD module connections
sbit LCD_RS at RB4_bit;
sbit LCD_EN at RB5_bit;
sbit LCD_D4 at RB0_bit;
sbit LCD_D5 at RB1_bit;
sbit LCD_D6 at RB2_bit;
sbit LCD_D7 at RB3_bit;
sbit LCD_RS_Direction at TRISB4_bit;
sbit LCD_EN_Direction at TRISB5_bit;
sbit LCD_D4_Direction at TRISB0_bit;
sbit LCD_D5_Direction at TRISB1_bit;
sbit LCD_D6_Direction at TRISB2_bit;
sbit LCD_D7_Direction at TRISB3_bit;
// End LCD module connections

void main() {
    cnt = 0;                   // Reset counter
    Keypad_Init();               // Initialize Keypad
    Lcd_Init();                 // Initialize Lcd
    Lcd_Cmd(_LCD_CLEAR);         // Clear display
    Lcd_Cmd(_LCD_CURSOR_OFF);     // Cursor off
    Lcd_Out(1, 1, "1");
    Lcd_Out(1, 1, "Key :");     // Write message text on Lcd
    Lcd_Out(2, 1, "Times:");

    do {
        kp = 0;                  // Reset key code variable

        // Wait for key to be pressed and released
        do
            kp = Keypad_Key_Press(); // Store key code in kp variable
        while(!kp);
```
// Prepare value for output, transform key to it's ASCII value
switch (kp) {
    //case 10: kp = 42; break;  // '*' // Uncomment this block for keypad4x3
    //case 11: kp = 48; break;  // '0'
    //case 12: kp = 35; break;  // '
    //default: kp += 48;

    case 1: kp = 49; break; // 1 // Uncomment this block for keypad4x4
    case 2: kp = 50; break; // 2
    case 3: kp = 51; break; // 3
    case 4: kp = 65; break; // A
    case 5: kp = 52; break; // 4
    case 6: kp = 53; break; // 5
    case 7: kp = 54; break; // 6
    case 8: kp = 66; break; // B
    case 9: kp = 55; break; // 7
    case 10: kp = 56; break; // 8
    case 11: kp = 57; break; // 9
    case 12: kp = 67; break; // C
    case 13: kp = 42; break; // *
    case 14: kp = 48; break; // 0
    case 15: kp = 35; break; // #
    case 16: kp = 68; break; // D
}

if (kp != oldstate) { // Pressed key differs from previous
    cnt = 1;
    oldstate = kp;
}
else { // Pressed key is same as previous
    cnt++;
}

Lcd_Chr(1, 10, kp); // Print key ASCII value on Lcd

if (cnt == 255) { // If counter variableble overflow
    cnt = 0;
    Lcd_Out(2, 10, " ");
}

WordToStr(cnt, txt); // Transform counter value to string
Lcd_Out(2, 10, txt); // Display counter value on Lcd
}
} while (1);
4x4 Keypad connection scheme
**LCD LIBRARY**

The *mikroC PRO for PIC* provides a library for communication with Lcds (with HD44780 compliant controllers) through the 4-bit interface. An example of Lcd connections is given on the schematic at the bottom of this page.

For creating a set of custom Lcd characters use Lcd Custom Character Tool.

### External dependencies of LCD Library

<table>
<thead>
<tr>
<th>The following variables must be defined in all projects using Lcd Library:</th>

## Library Routines

- Lcd_Init
- Lcd_Out
- Lcd_Out_Cp
- Lcd_Chr
- Lcd_Chr_Cp
- Lcd_Cmd

### Lcd_Init

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void Lcd_Init();</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Initializes LCD module.</td>
</tr>
</tbody>
</table>

**Requires**

Global variables:
- LCD_D7: Data bit 7
- LCD_D6: Data bit 6
- LCD_D5: Data bit 5
- LCD_D4: Data bit 4
- LCD_RS: Register Select (data/instruction) signal pin
- LCD_EN: Enable signal pin
- LCD_D7_Direction: Direction of the Data 7 pin
- LCD_D6_Direction: Direction of the Data 6 pin
- LCD_D5_Direction: Direction of the Data 5 pin
- LCD_D4_Direction: Direction of the Data 4 pin
- LCD_RS_Direction: Direction of the Register Select pin
- LCD_EN_Direction: Direction of the Enable signal pin

must be defined before using this function.

**Example**

```c
// Lcd pinout settings
sbit LCD_RS at RB4_bit;
sbit LCD_EN at RB5_bit;
sbit LCD_D7 at RB3_bit;
sbit LCD_D6 at RB2_bit;
sbit LCD_D5 at RB1_bit;
sbit LCD_D4 at RB0_bit;
// Pin direction
sbit LCD_RS_Direction at TRISB4_bit;
sbit LCD_EN_Direction at TRISB5_bit;
sbit LCD_D7_Direction at TRISB3_bit;
sbit LCD_D6_Direction at TRISB2_bit;
sbit LCD_D5_Direction at TRISB1_bit;
sbit LCD_D4_Direction at TRISB0_bit;
...
Lcd_Init();
```
### Lcd_Out

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void Lcd_Out(char row, char column, char *text);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Prints text on Lcd starting from specified position. Both string variables and literals can be passed as a text.</td>
</tr>
<tr>
<td>Parameters:</td>
<td></td>
</tr>
<tr>
<td>- <code>row</code>: starting position row number</td>
<td></td>
</tr>
<tr>
<td>- <code>column</code>: starting position column number</td>
<td></td>
</tr>
<tr>
<td>- <code>text</code>: text to be written</td>
<td></td>
</tr>
<tr>
<td>Requires</td>
<td>The Lcd module needs to be initialized. See Lcd_Init routine.</td>
</tr>
</tbody>
</table>
| Example   | // Write text "Hello!" on Lcd starting from row 1, column 3:  
|           | Lcd_Out(1, 3, "Hello"); |

### Lcd_Out_CP

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void Lcd_Out_CP(char *text);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Prints text on LCD at current cursor position. Both string variables and literals can be passed as a text.</td>
</tr>
<tr>
<td>Parameters:</td>
<td></td>
</tr>
<tr>
<td>- <code>text</code>: text to be written</td>
<td></td>
</tr>
<tr>
<td>Requires</td>
<td>The Lcd module needs to be initialized. See Lcd_Init routine.</td>
</tr>
</tbody>
</table>
| Example   | // Write text "Here!" at current cursor position:  
|           | Lcd_Out_CP("Here"); |
## Lcd_Chr

**Prototype**

```
void Lcd_Chr(char row, char column, char out_char);
```

**Returns**
Nothing.

**Description**
Prints character on LCD at specified position. Both variables and literals can be passed as a character.

Parameters:
- *row*: writing position row number
- *column*: writing position column number
- *out_char*: character to be written

**Requires**
The Lcd module needs to be initialized. See Lcd_Init routine.

**Example**
```
// Write character "i" at row 2, column 3:
Lcd_Chr(2, 3, 'i');
```

## Lcd_Chr_Cp

**Prototype**

```
void Lcd_Chr_CP(char out_char);
```

**Returns**
Nothing.

**Description**
Prints character on LCD at current cursor position. Both variables and literals can be passed as a character.

Parameters:
- *out_char*: character to be written

**Requires**
The Lcd module needs to be initialized. See Lcd_Init routine.

**Example**
```
// Write character "e" at current cursor position:
Lcd_Chr_CP('e');
```
### Lcd_Cmd

**Prototype**

```c
void Lcd_Cmd(char out_char);
```

**Returns**
Nothing.

**Description**

Sends command to LCD.

**Parameters:**
- `out_char`: command to be sent

**Note:** Predefined constants can be passed to the function, see Available LCD Commands.

**Requires**
The LCD module needs to be initialized. See Lcd_Init table.

**Example**

```c
// Clear Lcd display:
Lcd_Cmd(_LCD_CLEAR);
```

### Available LCD Commands

<table>
<thead>
<tr>
<th>Lcd Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>LCD_FIRST_ROW</td>
<td>Move cursor to the 1st row</td>
</tr>
<tr>
<td>LCD_SECOND_ROW</td>
<td>Move cursor to the 2nd row</td>
</tr>
<tr>
<td>LCD_THIRD_ROW</td>
<td>Move cursor to the 3rd row</td>
</tr>
<tr>
<td>LCD_FOURTH_ROW</td>
<td>Move cursor to the 4th row</td>
</tr>
<tr>
<td>LCD_CLEAR</td>
<td>Clear display</td>
</tr>
<tr>
<td>LCD_RETURN_HOME</td>
<td>Return cursor to home position, returns a shifted display to its original position. Display data RAM is unaffected.</td>
</tr>
<tr>
<td>LCD_CURSOR_OFF</td>
<td>Turn off cursor</td>
</tr>
<tr>
<td>LCD_UNDERLINE_ON</td>
<td>Underline cursor on</td>
</tr>
<tr>
<td>LCD_BLINK_CURSOR_ON</td>
<td>Blink cursor on</td>
</tr>
<tr>
<td>LCD_MOVE_CURSOR_LEFT</td>
<td>Move cursor left without changing display data RAM</td>
</tr>
<tr>
<td>LCD_MOVE_CURSOR_RIGHT</td>
<td>Move cursor right without changing display data RAM</td>
</tr>
<tr>
<td>LCD_TURN_ON</td>
<td>Turn LCD display on</td>
</tr>
<tr>
<td>LCD_TURN_OFF</td>
<td>Turn LCD display off</td>
</tr>
<tr>
<td>LCD_SHIFT_LEFT</td>
<td>Shift display left without changing display data RAM</td>
</tr>
<tr>
<td>LCD_SHIFT_RIGHT</td>
<td>Shift display right without changing display data RAM</td>
</tr>
</tbody>
</table>
Library Example

The following code demonstrates usage of the Lcd Library routines:

```c
// LCD module connections
sbit LCD_RS at RB4_bit;
sbit LCD_EN at RB5_bit;
sbit LCD_D4 at RB0_bit;
sbit LCD_D5 at RB1_bit;
sbit LCD_D6 at RB2_bit;
sbit LCD_D7 at RB3_bit;

sbit LCD_RS_Direction at TRISB4_bit;
sbit LCD_EN_Direction at TRISB5_bit;
sbit LCD_D4_Direction at TRISB0_bit;
sbit LCD_D5_Direction at TRISB1_bit;
sbit LCD_D6_Direction at TRISB2_bit;
sbit LCD_D7_Direction at TRISB3_bit;
// End LCD module connections

char txt1[] = "mikroElektronika";
char txt2[] = "EasyPIC5";
char txt3[] = "Lcd4bit";
char txt4[] = "example";

char i;        // Loop variable
void Move_Delay() {       // Function used for text moving
    Delay_ms(500);       // You can change the moving speed here
}

void main(){
    TRISB = 0;
    PORTB = 0xFF;
    TRISB = 0xff;
    ANSEL  = 0;          // Configure AN pins as digital I/O
    ANSELH = 0;
    Lcd_Init();         // Initialize LCD

    Lcd_Cmd(_LCD_CLEAR);       // Clear display
    Lcd_Cmd(_LCD_CURSOR_OFF);  // Cursor off
    Lcd_Out(1,6,txt3);        // Write text in first row

    Lcd_Out(2,6,txt4);        // Write text in second row
    Delay_ms(2000);
    Lcd_Cmd(_LCD_CLEAR);      // Clear display

    Lcd_Out(1,1,txt1);        // Write text in first row
    Lcd_Out(2,5,txt2);        // Write text in second row
}
```
Delay_ms(2000);

// Moving text
for(i=0; i<4; i++) { // Move text to the right 4 times
    Lcd_Cmd(_LCD_SHIFT_RIGHT);
    Move_Delay();
}

while(1) { // Endless loop
    for(i=0; i<8; i++) { // Move text to the left 7 times
        Lcd_Cmd(_LCD_SHIFT_LEFT);
        Move_Delay();
    }

    for(i=0; i<8; i++) { // Move text to the right 7 times
        Lcd_Cmd(_LCD_SHIFT_RIGHT);
        Move_Delay();
    }
}
}
HW connection

LCD HW connection
MANCHESTER CODE LIBRARY

The *mikroC PRO for PIC* provides a library for handling Manchester coded signals. The Manchester code is a code in which data and clock signals are combined to form a single self-synchronizing data stream; each encoded bit contains a transition at the midpoint of a bit period, the direction of transition determines whether the bit is 0 or 1; the second half is the true bit value and the first half is the complement of the true bit value (as shown in the figure below).

Manchester RF_Send_Byte format

![Manchester RF_Send_Byte format](image)

Notes: The Manchester receive routines are blocking calls (*Man_Receive_Init* and *Man_Synchro*). This means that MCU will wait until the task has been performed (e.g. byte is received, synchronization achieved, etc).

Note: Manchester code library implements time-based activities, so interrupts need to be disabled when using it.

External dependencies of Manchester Code Library

<table>
<thead>
<tr>
<th>The following variables must be defined in all projects using Manchester Code Library:</th>
<th>Description:</th>
<th>Example:</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>extern sfr sbit MAN-RXPIN;</code></td>
<td>Receive line.</td>
<td><code>sbit MANRXPIN at RC0_bit;</code></td>

<tr>
<td><code>extern sfr sbit MAN-TXPIN;</code></td>
<td>Transmit line.</td>
<td><code>sbit MANTXPIN at RC1_bit;</code></td>
</tr>
<tr>
<td><code>extern sfr sbit MAN-RXPIN_Direction;</code></td>
<td>Direction of the Receive pin.</td>
<td><code>sbit MANRXPIN_Direction at TRISC0_bit;</code></td>
</tr>
<tr>
<td><code>extern sfr sbit MAN-TXPIN_Direction;</code></td>
<td>Direction of the Transmit pin.</td>
<td><code>sbit MANTXPIN_Direction at TRISC1_bit;</code></td>
</tr>
</tbody>
</table>
Library Routines

- Man_Receive_Init
- Man_Receive
- Man_Send_Init
- Man_Send
- Man_Synchro
- Man_Break

The following routines are for the internal use by compiler only:

- Manchester_0
- Manchester_1
- Manchester_Out

**Man_Receive_Init**

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned int Man_Receive_Init();</code></th>
</tr>
</thead>
</table>
| Returns   | - 0 - if initialization and synchronization were successful.  
            - 1 - upon unsuccessful synchronization.  
            - 255 - upon user abort. |
| Description | The function configures Receiver pin and performs synchronization procedure in order to retrieve baud rate out of the incoming signal.  
              **Note:** In case of multiple persistent errors on reception, the user should call this routine once again or Man_Synchro routine to enable synchronization. |
| Requires  | Global variables:  
            MANRXPIN: Receive line  
            MANRXPIN_Direction: Direction of the receive pin |
| Example   | // Initialize Receiver  
            sbit MANRXPIN at RC0_bit;  
            sbit MANRXPIN_Direction at TRISC0_bit;  
            ...  
            Man_Receive_Init(); |
### Man_Receive

<table>
<thead>
<tr>
<th>Prototype</th>
<th>unsigned char Man_Receive(unsigned char *error);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>A byte read from the incoming signal.</td>
</tr>
<tr>
<td>Description</td>
<td>The function extracts one byte from incoming signal.</td>
</tr>
<tr>
<td>Parameters</td>
<td>- error: error flag. If signal format does not match the expected, the error flag will be set to non-zero.</td>
</tr>
<tr>
<td>Requires</td>
<td>To use this function, the user must prepare the MCU for receiving. See Man_Receive_Init.</td>
</tr>
<tr>
<td>Example</td>
<td>unsigned char data = 0, error = 0;</td>
</tr>
<tr>
<td></td>
<td>...</td>
</tr>
<tr>
<td></td>
<td>data = Man_Receive(&amp;error);</td>
</tr>
<tr>
<td></td>
<td>if (error)</td>
</tr>
<tr>
<td></td>
<td>{ /* error handling */ }</td>
</tr>
</tbody>
</table>

### Man_Send_Init

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void Man_Send_Init();</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>The function configures Transmitter pin.</td>
</tr>
<tr>
<td>Requires</td>
<td>Global variables:</td>
</tr>
<tr>
<td></td>
<td><strong>MANTXPIN</strong>: Transmit line</td>
</tr>
<tr>
<td></td>
<td><strong>MANTXPIN_Direction</strong>: Direction of the transmit pin</td>
</tr>
<tr>
<td></td>
<td>must be defined before using this function.</td>
</tr>
<tr>
<td>Example</td>
<td>// Initialize Transmitter:</td>
</tr>
<tr>
<td></td>
<td>sbit MANTXPIN at RC1_bit;</td>
</tr>
<tr>
<td></td>
<td>sbit MANTXPIN_Direction at TRISC1_bit;</td>
</tr>
<tr>
<td></td>
<td>...</td>
</tr>
<tr>
<td></td>
<td>Man_Send_Init();</td>
</tr>
</tbody>
</table>
### Man_Send

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void Man_Send(unsigned char tr_data);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Sends one byte.</td>
</tr>
<tr>
<td>Parameters:</td>
<td></td>
</tr>
<tr>
<td>- <code>tr_data</code>: data to be sent</td>
<td></td>
</tr>
<tr>
<td>Note:</td>
<td>Baud rate used is 500 bps.</td>
</tr>
<tr>
<td>Requires</td>
<td>To use this function, the user must prepare the MCU for sending. See <code>Man_Send_Init</code>.</td>
</tr>
<tr>
<td>Example</td>
<td><code>unsigned char msg;</code></td>
</tr>
<tr>
<td></td>
<td><code>...</code></td>
</tr>
<tr>
<td></td>
<td><code>Man_Send(msg);</code></td>
</tr>
</tbody>
</table>

### Man_Synchro

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned char Man_Synchro();</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>- 255 - if synchronization was not successful.</td>
</tr>
<tr>
<td></td>
<td>- Half of the manchester bit length, given in multiples of 10us - upon successful synchronization.</td>
</tr>
<tr>
<td>Description</td>
<td>Measures half of the manchester bit length with 10us resolution.</td>
</tr>
<tr>
<td>Requires</td>
<td>To use this function, you must first prepare the MCU for receiving. See <code>Man_Receive_Init</code>.</td>
</tr>
<tr>
<td>Example</td>
<td><code>unsigned int man__half_bit_len;</code></td>
</tr>
<tr>
<td></td>
<td><code>...</code></td>
</tr>
<tr>
<td></td>
<td><code>man__half_bit_len = Man_Synchro();</code></td>
</tr>
</tbody>
</table>
## Man_Break

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void Man_Break();</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Man_Receive is blocking routine and it can block the program flow. Call this routine from interrupt to unblock the program execution. This mechanism is similar to WDT.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Interrupts should be disabled before using Manchester routines again (see note at the top of this page).</td>
</tr>
<tr>
<td>Requires</td>
<td>Nothing.</td>
</tr>
</tbody>
</table>

### Example

```c
char data1, error, counter = 0;

void interrupt {
    if (INTCON.T0IF) {
        if (counter >= 20) {
            Man_Break();
            counter = 0; // reset counter
        }
    } else {
        counter++; // increment counter
        INTCON.T0IF = 0; // Clear Timer0 overflow interrupt flag
    }
}

void main() {
    OPTION_REG = 0x04; // TMR0 prescaler set to 1:32
    ...
    Man_Receive_Init();
    ...
    // try Man_Receieve with blocking prevention mechanism
    INTCON.GIE = 1; // Global interrupt enable
    INTCON.T0IE = 1; // Enable Timer0 overflow
    interrupt
        data1 = Man_Receive(&error);
    INTCON.GIE = 0; // Global interrupt disable
    ...
}
```
Library Example

The following code is code for the Manchester receiver, it shows how to use the Manchester Library for receiving data:

```
// LCD module connections
sbit LCD_RS at RB4_bit;
sbit LCD_EN at RB5_bit;
sbit LCD_D4 at RB0_bit;
sbit LCD_D5 at RB1_bit;
sbit LCD_D6 at RB2_bit;
sbit LCD_D7 at RB3_bit;

sbit LCD_RS_Direction at TRISB4_bit;
sbit LCD_EN_Direction at TRISB5_bit;
sbit LCD_D4_Direction at TRISB0_bit;
sbit LCD_D5_Direction at TRISB1_bit;
sbit LCD_D6_Direction at TRISB2_bit;
sbit LCD_D7_Direction at TRISB3_bit;
// End LCD module connections

// Manchester module connections
sbit MANRXPIN at RC0_bit;
sbit MANRXPIN_Direction at TRISC0_bit;
sbit MANTXPIN at RC1_bit;
sbit MANTXPIN_Direction at TRISC1_bit;
// End Manchester module connections

char error, ErrorCount, temp;

void main() {
    ErrorCount = 0;
    ANSEL = 0;           // Configure AN pins as digital I/O
    ANSELH = 0;
    TRISC.F5 = 0;       // Configure AN pins as digital I/O
    LCD_Init(); // Initialize LCD
    Lcd_Cmd(_LCD_CLEAR); // Clear LCD display
    Man_Receive_Init(); // Initialize Receiver

    while (1) { // Endless loop
        Lcd_Cmd(_LCD_FIRST_ROW); // Move cursor to the 1st row
        while (1) { // Wait for the "start" byte
            temp = Man_Receive(&error); // Attempt byte receive
            if (temp == 0x0B) // "Start" byte, see Transmitter example
                break; // We got the starting sequence
        }
    }
}
```
if (error)          // Exit so we do not loop forever
    break;
}

do
{
    temp = Man_Receive(&error); // Attempt byte receive
    if (error) {                // If error occurred
        Lcd_Chr_CP('?');       // Write question mark on LCD
        ErrorCount++;          // Update error counter
        if (ErrorCount > 20) { // In case of multiple errors
            temp = Man_Synchro(); // Try to synchronize again
            //Man_Receive_Init(); // Alternative, try to Initialize Receiver again
            ErrorCount = 0;       // Reset error counter
        }
    } else {                   // No error occurred
        if (temp != 0x0E) // If "End" byte was received (see Transmitter example)
            Lcd_Chr_CP(temp); // do not write received byte on LCD
    }
    Delay_ms(25);
} while (temp != 0x0E); // If "End" byte was received exit do loop
}
The following code is code for the Manchester transmitter, it shows how to use the Manchester Library for transmitting data:

```c
// Manchester module connections
sbit MANRXPIN at RC0_bit;
sbit MANRXPIN_Direction at TRISC0_bit;
sbit MANTXPIN at RC1_bit;
sbit MANTXPIN_Direction at TRISC1_bit;
// End Manchester module connections

char index, character;
char s1[] = "mikroElektronika";

void main() {
    Man_Send_Init();          // Initialize transmitter
    while (1) {               // Endless loop
        Man_Send(0x0B);        // Send "start" byte
        Delay_ms(100);         // Wait for a while

        character = s1[0];     // Take first char from string
        index = 0;             // Initialize index variable
        while (character) {    // String ends with zero
            Man_Send(character);  // Send character
            Delay_ms(90);        // Wait for a while
            index++;            // Increment index variable
            character = s1[index];  // Take next char from string
        }
        Man_Send(0x0E);        // Send "end" byte
    }
    Delay_ms(1000);
}
```

MULTI MEDIA CARD LIBRARY

The Multi Media Card (MMC) is a flash memory card standard. MMC cards are currently available in sizes up to and including 1 GB, and are used in cell phones, mp3 players, digital cameras, and PDAs.

*mikroC PRO for PIC* provides a library for accessing data on Multi Media Card via SPI communication. This library also supports SD (Secure Digital) memory cards.

Secure Digital Card

Secure Digital (SD) is a flash memory card standard, based on the older Multi Media Card (MMC) format. SD cards are currently available in sizes of up to and including 2 GB, and are used in cell phones, mp3 players, digital cameras, and PDAs.

**Notes:**

- Library works with PIC18 family only;
- The library uses the SPI module for communication. User must initialize SPI module before using the SPI Graphic Lcd Library.
- For MCUs with two SPI modules it is possible to initialize both of them and then switch by using the `SPI_Set_Active()` routine.
- Routines for file handling can be used only with FAT16 file system.
- Library functions create and read files from the root directory only;
- Library functions populate both FAT1 and FAT2 tables when writing to files, but the file data is being read from the FAT1 table only; i.e. there is no recovery if FAT1 table is corrupted.

**Note:** The SPI module has to be initialized through `SPI1_Init_Advanced` routine with the following parameters:

- SPI Master
- 8bit mode
- primary prescaler 16
- Slave Select disabled
- data sampled in the middle of data output time
- clock idle low
- Serial output data changes on transition from idle clock state to active clock state

`SPI1_Init_Advanced(_SPI_MASTER_OSC_DIV16, _SPI_DATA_SAMPLE_MIDDLE, _SPI_CLK_IDLE_LOW, _SPI_LOW_2_HIGH);` must be called before initializing `Mmc_Init`.
Note: Once the MMC/SD card is initialized, the user can reinitialize SPI at higher speed. See the Mmc_Init and Mmc_Fat_Init routines.

External dependencies of MMC Library

<table>
<thead>
<tr>
<th>The following variable must be defined in all projects using MMC library:</th>
<th>Description:</th>
<th>Example:</th>
</tr>
</thead>
<tbody>
<tr>
<td>extern sfr sbit Mmc_Chip_Select;</td>
<td>Chip select pin.</td>
<td>sbit Mmc_Chip_Select at RC2_bit</td>

<td>Direction of the chip select pin.</td>
<td>sbit Mmc_Chip_Select_Direction at TRISC2_bit;</td>
</tr>
</tbody>
</table>

Library Routines

- Mmc_Init
- Mmc_Read_Sector
- Mmc_Write_Sector
- Mmc_Read_Cid
- Mmc_Read_Csd

Routines for file handling:

- Mmc_Fat_Init
- Mmc_Fat_QuickFormat
- Mmc_Fat_Assign
- Mmc_Fat_Reset
- Mmc_Fat_Read
- Mmc_Fat_Rewrite
- Mmc_Fat_Append
- Mmc_Fat_Delete
- Mmc_Fat_Write
- Mmc_Fat_Set_File_Date
- Mmc_Fat_Get_File_Date
- Mmc_Fat_Get_File_Size
- Mmc_Fat_Get_Swap_File
# Mmc_Init

**Prototype**

```c
unsigned char Mmc_Init();
```

**Returns**

- 0 - if MMC/SD card was detected and successfully initialized
- 1 - otherwise

**Description**

Initializes hardware SPI communication; The function returns 1 if MMC card is present and successfully initialized, otherwise returns 0. Mmc_Init needs to be called before using other functions of this library.

**Requires**

Global variables:

- `Mmc_Chip_Select`: Chip Select line
- `Mmc_Chip_Select_Direction`: Direction of the Chip Select pin

must be defined before using this function.

**Example**

```c
// MMC module connections
sfr sbit Mmc_Chip_Select at RC2_bit;
sfr sbit Mmc_Chip_Select_Direction at TRISC2_bit;
// MMC module connections
...
SPI1_Init();
error = Mmc_Init();  // Init with CS line at RC2_bit
```

# Mmc_Read_Sector

**Prototype**

```c
unsigned char Mmc_Read_Sector(unsigned long sector, char* dbuff);
```

**Returns**

Returns 0 if read was successful, or 1 if an error occurred.

**Description**

Function reads one sector (512 bytes) from MMC card at sector address `sector`. Read data is stored in the array `data`. Function returns 0 if read was successful, or 1 if an error occurred.

**Requires**

Library needs to be initialized, see Mmc_Init.

**Example**

```c
error = Mmc_Read_Sector(sector, data);
```
### Mmc_Write_Sector

</tbody>
</table>
# Mmc_Fat_Init

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned short Mmc_Fat_Init();</code></th>
</tr>
</thead>
</table>
| Returns   | - 0 - if MMC/SD card was detected and successfully initialized  
- 1 - if FAT16 boot sector was not found  
- 255 - if MMC/SD card was not detected |
| Description | Initializes MMC/SD card, reads MMC/SD FAT16 boot sector and extracts necessary data needed by the library.  
| Note: | MMC/SD card has to be formatted to FAT16 file system. |
| Requires  | Global variables:  
- `Mmc_Chip_Select`: Chip Select line  
- `Mmc_Chip_Select_Direction`: Direction of the Chip Select pin |
|          | must be defined before using this function. |
|          | The appropriate hardware SPI module must be previously initialized. See the SPI1_Init, SPI1_Init_Advanced routines. |
| Example  | // MMC module connections  
`sfr sbit Mmc_Chip_Select at RC2_bit;`  
`sfr sbit Mmc_Chip_Select_Direction at TRISC2_bit;`  
// MMC module connections  

// Initialize SPI1 module and set pointer(s) to SPI1 functions  
SPI1_Init_Advanced(MASTER_OSC_DIV64, DATA_SAMPLE_MIDDLE,  
CLK_IDLE_LOW, LOW_2_HIGH);  

// use fat16 quick format instead of init routine if a formatting is needed  
if (!Mmc_Fat_Init()) {  
// reinitialize SPI1 at higher speed  
SPI1_Init_Advanced(MASTER_OSC_DIV4, DATA_SAMPLE_MIDDLE,  
CLK_IDLE_LOW, LOW_2_HIGH);  
...  
}
**Mmc_Fat_QuickFormat**

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned char Mmc_Fat_QuickFormat(char * mmc_fat_label);</code></th>
</tr>
</thead>
</table>
| Returns   | - 0 - if MMC/SD card was detected and successfully initialized  
   - 1 - if FAT16 format was unsuccessful  
   - 255 - if MMC/SD card was not detected |
| Description | Formats to FAT16 and initializes MMC/SD card.  
Parameters:  
- `mmc_fat_label`: volume label (11 characters in length). If less than 11 characters are provided, the label will be padded with spaces. If null string is passed volume will not be labeled  
Note: This routine can be used instead or in conjunction with Mmc_Fat_Init routine.  
Note: If MMC/SD card already contains a valid boot sector, it will remain unchanged (except volume label field) and only FAT and ROOT tables will be erased. Also, the new volume label will be set. |
| Requires  | The appropriate hardware SPI module must be previously initialized. |
| Example   | // Initialize SPI1 module and set pointer(s) to SPI1 functions  
SPI1_Init_Advanced(MASTER_OSC_DIV64, DATA_SAMPLE_MIDDLE,  
CLK_IDLE_LOW, LOW_2_HIGH);  

// Format and initialize MMC/SD card and MMC_FAT16 library globals  
if (!Mmc_Fat_QuickFormat(&mmc_fat_label)) {  
    // Reinitialize the SPI module at higher speed (change primary prescaler).  
    SPI1_Init_Advanced(MASTER_OSC_DIV4, DATA_SAMPLE_MIDDLE,  
    CLK_IDLE_LOW, LOW_2_HIGH);  
    ...  
} |
### Mmc_Fat_Assign

#### Prototype

```
unsigned short Mmc_Fat_Assign(char * filename, char file_cre_attr);
```

#### Returns

- 1 - if file already exists or file does not exist but new file is created.
- 0 - if file does not exist and no new file is created.

#### Description

Assigns file for file operations (read, write, delete...). All subsequent file operations will be applied over the assigned file.

**Parameters:**

- **filename**: name of the file that should be assigned for file operations. File name should be in DOS 8.3 (file_name.extension) format. The file name and extension will be automatically padded with spaces by the library if they have less than length required (i.e. "mikro.tx" -> "mikro .tx"), so the user does no have to take care of that. The file name and extension are case insensitive. The library will convert them to proper case automatically, so the user does not have to take care of that. Also, in order to keep backward compatibility with first version of this library, file names can be entered as UPPERCASE string of 11 bytes in length with no dot character between file name and extension (i.e. "MIKROELETXT" -> MIKROELE.TXT). In this case last 3 characters of the string are considered to be file extension.

- **file_cre_attr**: file creation and attributs flags. Each bit corresponds to appropriate file attribut:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Mask</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0x01</td>
<td>Read Only</td>
</tr>
<tr>
<td>1</td>
<td>0x02</td>
<td>Hidden</td>
</tr>
<tr>
<td>2</td>
<td>0x04</td>
<td>System</td>
</tr>
<tr>
<td>3</td>
<td>0x08</td>
<td>Volume Label</td>
</tr>
<tr>
<td>4</td>
<td>0x10</td>
<td>Subdirectory</td>
</tr>
<tr>
<td>5</td>
<td>0x20</td>
<td>Archive</td>
</tr>
<tr>
<td>6</td>
<td>0x40</td>
<td>Device (internal use only, never found on disk)</td>
</tr>
<tr>
<td>7</td>
<td>0x80</td>
<td>File creation flag. If file does not exist and this flag is set, new file with specified name will be created.</td>
</tr>
</tbody>
</table>

**Note**: Long File Names (LFN) are not supported.

#### Requires

MMC/SD card and MMC library must be initialized for file operations. See Mmc_Fat_Init.

#### Example

```c
//Create file with archive attribut if it does not already exists
Mmc_Fat_Assign('MIKROELE.TXT',0xA0);
```
### Mmc_Fat_Reset

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void Mmc_Fat_Reset(unsigned long * size);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Procedure resets the file pointer (moves it to the start of the file) of the assigned file, so that the file can be read. Parameter size stores the size of the assigned file, in bytes.</td>
</tr>
<tr>
<td>Requires</td>
<td>The file must be assigned, see Mmc_Fat_Assign.</td>
</tr>
<tr>
<td>Example</td>
<td>Mmc_Fat_Reset(size);</td>
</tr>
</tbody>
</table>

### Mmc_Fat_Rewrite

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void Mmc_Fat_Rewrite();</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Procedure resets the file pointer and clears the assigned file, so that new data can be written into the file.</td>
</tr>
<tr>
<td>Requires</td>
<td>The file must be assigned, see Mmc_Fat_Assign.</td>
</tr>
<tr>
<td>Example</td>
<td>Mmc_Fat_Rewrite;</td>
</tr>
</tbody>
</table>

### Mmc_Fat_Append

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void Mmc_Fat_Append();</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>The procedure moves the file pointer to the end of the assigned file, so that data can be appended to the file.</td>
</tr>
<tr>
<td>Requires</td>
<td>The file must be assigned, see Mmc_Fat_Assign.</td>
</tr>
<tr>
<td>Example</td>
<td>Mmc_Fat_Append;</td>
</tr>
</tbody>
</table>
### Mmc_Fat_Read

**Prototype**

```c
void Mmc_Fat_Read(unsigned short *bdata);
```

**Returns**

Nothing.

**Description**

Procedure reads the byte at which the file pointer points to and stores data into parameter data. The file pointer automatically increments with each call of `Mmc_Fat_Read`.

**Requires**

The file must be assigned, see `Mmc_Fat_Assign`. Also, file pointer must be initialized; see `Mmc_Fat_Reset`.

**Example**

```c
Mmc_Fat_Read(mydata);
```

### Mmc_Fat_Delete

**Prototype**

```c
void Mmc_Fat_Delete();
```

**Returns**

Nothing.

**Description**

Deletes currently assigned file from MMC/SD card.

**Requires**

MMC/SD card and MMC library must be initialized for file operations. See `Mmc_Fat_Init`. The file must be previously assigned. See `Mmc_Fat_Assign`.

**Example**

```c
// delete current file
Mmc_Fat_Delete();
```

### Mmc_Fat_Write

**Prototype**

```c
void Mmc_Fat_Write(char * fdata, unsigned data_len);
```

**Returns**

Nothing.

**Description**

Procedure writes a chunk of bytes (`fdata`) to the currently assigned file, at the position of the file pointer.

**Requires**

The file must be assigned, see `Mmc_Fat_Assign`. Also, file pointer must be initialized; see `Mmc_Fat_Append` or `Mmc_Fat_Rewrite`.

**Example**

```c
Mmc_Fat_Write(txt,255);
Mmc_Fat_Write('Hello world',255);
```
### Mmc_Fat_Set_File_Date

**Prototype**

```c
void Mmc_Fat_Set_File_Date(unsigned int year, unsigned short month, unsigned short day, unsigned short hours, unsigned short mins, unsigned short seconds);
```

**Returns**

Nothing.

**Description**

Writes system timestamp to a file. Use this routine before each writing to file; otherwise, the file will be appended an unknown timestamp.

**Requires**

The file must be assigned, see Mmc_Fat_Assign. Also, file pointer must be initialized; see Mmc_Fat_Reset.

**Example**

```c
// April 1st 2005, 18:07:00
Mmc_Fat_Set_File_Date(2005, 4, 1, 18, 7, 0);
```

### Mmc_Fat_Get_File_Date

**Prototype**

```c
void Mmc_Fat_Get_File_Date(unsigned int *year, unsigned short *month, unsigned short *day, unsigned short *hours, unsigned short *mins);
```

**Returns**

Nothing.

**Description**

Retrieves date and time for the currently selected file. Seconds are not being retrieved since they are written in 2-sec increments.

**Requires**

The file must be assigned, see Mmc_Fat_Assign.

**Example**

```c
// get Date/time of file
unsigned yr;
char mnth, dat, hrs, mins;
...
file_Name = "MYFILEABTXT";
Mmc_Fat_Assign(file_Name);
Mmc_Fat_Get_File_Date(yr, mnth, dat, hrs, mins);
```

### Mmc_Fat_Get_File_Size

**Prototype**

```c
unsigned long Mmc_Fat_Get_File_Size();
```

**Returns**

This function returns size of active file (in bytes).

**Description**

Retrieves size for currently selected file.

**Requires**

The file must be assigned, see Mmc_Fat_Assign.

**Example**

```c
// get Date/time of file
unsigned yr;
char mnth, dat, hrs, mins;
...
file_name = "MYFILEXXTXT";
Mmc_Fat_Assign(file_name);
mmc_size = Mmc_Fat_Get_File_Size;
```
### Mmc_Fat_Get_Swap_File

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned long Mmc_Fat_Get_Swap_File(unsigned long sectors_cnt, char* filename, char file_attr);</code></th>
</tr>
</thead>
</table>
| Returns   | - Number of the start sector for the newly created swap file, if there was enough free space on the MMC/SD card to create file of required size.  
- `0` - otherwise. |

This function is used to create a swap file of predefined name and size on the MMC/SD media. If a file with specified name already exists on the media, search for consecutive sectors will ignore sectors occupied by this file. Therefore, it is recommended to erase such file if it exists before calling this function. If it is not erased and there is still enough space for new swap file, this function will delete it after allocating new memory space for new swap file.

The purpose of the swap file is to make reading and writing to MMC/SD media as fast as possible, by using the Mmc_Read_Sector() and Mmc_Write_Sector() functions directly, without potentially damaging the FAT system. Swap file can be considered as a "window" on the media where user can freely write/read the data. It's main purpose in mikroC's library is to be used for fast data acquisition; when the time-critical acquisition has finished, the data can be re-written into a "normal" file, and formatted in the most suitable way.

#### Parameters:

- `sectors_cnt`: number of consecutive sectors that user wants the swap file to have.
- `filename`: name of the file that should be assigned for file operations. File name should be in DOS 8.3 (`file_name.extension`) format. The file name and extension will be automatically padded with spaces by the library if they have less than length required (i.e. "mikro.tx" -> "mikro .tx "), so the user does no have to take care of that. The file name and extension are case insensitive. The library will convert them to proper case automatically, so the user does not have to take care of that.

Also, in order to keep backward compatibility with first version of this library, file names can be entered as UPPERCASE string of 11 bytes in length with no dot character between file name and extension (i.e. "MIKROELEXTXT" -> MIKROELE.TXT). In this case last 3 characters of the string are considered to be file extension.
- **file_attr**: file creation and attributes flags. Each bit corresponds to appropriate file attribute:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Mask</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0x01</td>
<td>Read Only</td>
</tr>
<tr>
<td>1</td>
<td>0x02</td>
<td>Hidden</td>
</tr>
<tr>
<td>2</td>
<td>0x04</td>
<td>System</td>
</tr>
<tr>
<td>3</td>
<td>0x08</td>
<td>Volume Label</td>
</tr>
<tr>
<td>4</td>
<td>0x10</td>
<td>Subdirectory</td>
</tr>
<tr>
<td>5</td>
<td>0x20</td>
<td>Archive</td>
</tr>
<tr>
<td>6</td>
<td>0x40</td>
<td>Device (internal use only, never found on disk)</td>
</tr>
<tr>
<td>7</td>
<td>0x80</td>
<td>Not used</td>
</tr>
</tbody>
</table>

**Note**: Long File Names (LFN) are not supported.

**Requires**: MMC/SD card and MMC library must be initialized for file operations. See Mmc_Fat_Init.

**Example**

```c
//-------------- Tries to create a swap file, whose size will be at least 100 sectors.
//If it succeeds, it sends the No. of start sector over UART
void M_Create_Swap_File(){
    size = Mmc_Fat_Get_Swap_File(100);
    if (size <> 0) {
        UART_Write(0xAA);
        UART_Write(Lo(size));
        UART_Write(Hi(size));
        UART_Write(Higher(size));
        UART_Write(Highest(size));
        UART_Write(0xAA);
    }
}
```
Library Example

The following example demonstrates MMC library test. Upon flashing, insert a MMC/SD card into the module, when you should receive the "Init-OK" message. Then, you can experiment with MMC read and write functions, and observe the results through the Usart Terminal.

```c
// MMC module connections
sbit Mmc_Chip_Select at RC2_bit;
sbit Mmc_Chip_Select_Direction at TRISC2_bit;
//_eof MMC module connections

// Variables for MMC routines
unsigned char SectorData[512]; // Buffer for MMC sector reading/writing
unsigned char data_for_registers[16];// buffer for CID and CSD registers

// UART1 write text and new line (carriage return + line feed)
void UART1_Write_Line(char *uart_text) {
    UART1_Write_Text(uart_text);
    UART1_Write(13);
    UART1_Write(10);
}

// Display byte in hex
void PrintHex(unsigned char i) {
    unsigned char hi,lo;
    hi = i & 0xF0;             // High nibble
    hi = hi >> 4;
    hi = hi + '0';
    if (hi>'9') hi=hi+7;
    lo = (i & 0x0F) + '0';       // Low nibble
    if (lo>'9') lo=lo+7;
    UART1_Write(hi);
    UART1_Write(lo);
}

void main() {
    const char FILL_CHAR = 'm';
    unsigned int i, SectorNo;
    char mmc_error;
    bit data_ok;

    ADCON1 |= 0x0F;             // Configure AN pins as digital
    CMCON  |= 7;               // Turn off comparators

    // Initialize UART1 module
```
UART1_Init(19200);
Delay_ms(10);

UART1_Write_Line("PIC-Started"); // PIC present report

// Initialize SPI1 module
SPI1_Init_Advanced(_SPI_MASTER_OSC_DIV64, _SPI_DATA_SAMPLE_MIDDLE,
_SPI_CLK_IDLE_LOW, _SPI_LOW_2_HIGH);

// Initialise a MMC card
mmc_error = Mmc_Init();
if (mmc_error == 0)
    UART1_Write_Line("MMC Init-OK"); // If MMC present report
else
    UART1_Write_Line("MMC Init-error"); // If error report

// Fill MMC buffer with same characters
for (i=0; i<=511; i++)
    SectorData[i] = FILL_CHAR;

// Write sector
mmc_error = Mmc_Write_Sector(SectorNo, SectorData);
if (mmc_error == 0)
    UART1_Write_Line("Write-OK");
else // if there are errors.....
    UART1_Write_Line("Write-Error");

// Reading of CID register
mmc_error = Mmc_Read_Cid(data_for_registers);
if (mmc_error == 0) {
    UART1_Write_Text("CID : ");
    for (i=0; i<=15; i++)
        PrintHex(data_for_registers[i]);
    UART1_Write_Line(""");
}
else
    UART1_Write_Line("CID-error");

// Reading of CSD register
mmc_error = Mmc_Read_Csd(data_for_registers);
if (mmc_error == 0) {
    UART1_Write_Text("CSD : ");
    for (i=0; i<=15; i++)
        PrintHex(data_for_registers[i]);
    UART1_Write_Line(""");
}
else
    UART1_Write_Line("CSD-error");

// Read sector
mmc_error = Mmc_Read_Sector(SectorNo, SectorData);
if (mmc_error == 0) {
    UART1_Write_Line("Read-OK");
    // Chech data match
    data_ok = 1;
    for(i=0; i<=511; i++) {
        UART1_Write(SectorData[i]);
        if (SectorData[i] != FILL_CHAR) {
            data_ok = 0;
            break;
        }
    }
    UART1_Write_Line("");
    if (data_ok)
        UART1_Write_Line("Content-OK");
    else
        UART1_Write_Line("Content-Error");
} else  // if there are errors.....
    UART1_Write_Line("Read-Error");

    // Signal test end
    UART1_Write_Line("Test End.");
}

ONEWIRE LIBRARY

The OneWire library provides routines for communication via the Dallas OneWire protocol, for example with DS18x20 digital thermometer. OneWire is a Master/Slave protocol, and all communication cabling required is a single wire. OneWire enabled devices should have open collector drivers (with single pull-up resistor) on the shared data line.

Slave devices on the OneWire bus can even get their power supply from data line. For detailed schematic see device datasheet.

Some basic characteristics of this protocol are:

- single master system,
- low cost,
- low transfer rates (up to 16 kbps),
- fairly long distances (up to 300 meters),
- small data transfer packages.

Each OneWire device also has a unique 64-bit registration number (8-bit device type, 48-bit serial number and 8-bit CRC), so multiple slaves can co-exist on the same bus.

Note that oscillator frequency Fosc needs to be at least 4MHz in order to use the routines with Dallas digital thermometers.

Note: This library implements time-based activities, so interrupts need to be disabled when using OneWire library.

Library Routines

- Ow_Reset
- Ow_Read
- Ow_Write
### Ow_Reset

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned short Ow_Reset(unsigned short *port, unsigned short pin);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>0 if DS1820 is present, and 1 if not present.</td>
</tr>
<tr>
<td>Description</td>
<td>Issues OneWire reset signal for DS1820. Parameters PORT and pin specify the location of DS1820.</td>
</tr>
<tr>
<td>Requires</td>
<td>Works with Dallas DS1820 temperature sensor only.</td>
</tr>
<tr>
<td>Example</td>
<td>To reset the DS1820 that is connected to the RA5 pin:</td>
</tr>
<tr>
<td></td>
<td><code>Ow_Reset(&amp;PORTA, 5);</code></td>
</tr>
</tbody>
</table>

### Ow_Read

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned short Ow_Read(unsigned short *port, unsigned short pin);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Data read from an external device over the OneWire bus.</td>
</tr>
<tr>
<td>Description</td>
<td>Reads one byte of data via the OneWire bus.</td>
</tr>
<tr>
<td>Requires</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Example</td>
<td>`unsigned short tmp;</td>
</tr>
<tr>
<td></td>
<td>...</td>
</tr>
<tr>
<td></td>
<td><code>tmp = Ow_Read(&amp;PORTA, 5);</code></td>
</tr>
</tbody>
</table>

### Ow_Write

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void Ow_Write(unsigned short *port, unsigned short pin, unsigned short par);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Writes one byte of data (argument <code>par</code>) via OneWire bus.</td>
</tr>
<tr>
<td>Requires</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Example</td>
<td><code>Ow_Write(&amp;PORTA, 5, 0xCC);</code></td>
</tr>
</tbody>
</table>
This example reads the temperature using DS18x20 connected to pin PORTA.B5. After reset, MCU obtains temperature from the sensor and prints it on the Lcd. Make sure to pull-up PORTA.B5 line and to turn off the PORTA LEDs.

}
Example of DS1820 connection
PORT EXPANDER LIBRARY

The *mikroC PRO for PIC* provides a library for communication with the Microchip’s Port Expander MCP23S17 via SPI interface. Connections of the PIC compliant MCU and MCP23S17 is given on the schematic at the bottom of this page.

**Note:** Library does not use Port Expander interrupts.

**Note:** The appropriate hardware SPI module must be initialized before using any of the Port Expander library routines. Refer to SPI Library.

**External dependencies of Port Expander Library**

### Expander_Read_Byte

**Prototype**

```c
char Expander_Read_Byte(char ModuleAddress, char RegAddress);
```

**Returns**

Byte read.

**Description**

The function reads byte from Port Expander.

Parameters:

- `ModuleAddress`: Port Expander hardware address, see schematic at the bottom of this page
- `RegAddress`: Port Expander's internal register address

**Requires**

Port Expander must be initialized. See Expander_Init.

**Example**

```c
// Read a byte from Port Expander's register
char read_data;
...  
read_data = Expander_Read_Byte(0,1);
```

### Expander_Write_Byte

**Prototype**

```c
void Expander_Write_Byte(char ModuleAddress, char RegAddress, char Data);
```

**Returns**

Nothing.

**Description**

Routine writes a byte to Port Expander.

Parameters:

- `ModuleAddress`: Port Expander hardware address, see schematic at the bottom of this page
- `RegAddress`: Port Expander's internal register address
- `Data_`: data to be written

**Requires**

Port Expander must be initialized. See Expander_Init.

**Example**

```c
// Write a byte to the Port Expander's register
Expander_Write_Byte(0,1,$FF);
```
### Expander_Read_PortA

**Prototype**

```c
char Expander_Read_PortA(char ModuleAddress);
```

**Returns**

Byte read.

**Description**

The function reads byte from Port Expander's PortA.

**Parameters:**

- `ModuleAddress`: Port Expander hardware address, see schematic at the bottom of this page

**Requires**

Port Expander must be initialized. See Expander_Init.

Port Expander's PortA should be configured as an input. See Expander_Set_DirectionPortA and Expander_Set_DirectionPortAB routines.

**Example**

```c
// Read a byte from Port Expander's PORTA
char read_data;
...
Expander_Set_DirectionPortA(0,0xFF); // set expander's porta to be input
...
read_data = Expander_Read_PortA(0);
```

### Expander_Read_PortB

**Prototype**

```c
char Expander_Read_PortB(char ModuleAddress);
```

**Returns**

Byte read.

**Description**

The function reads byte from Port Expander's PortB.

**Parameters:**

- `ModuleAddress`: Port Expander hardware address, see schematic at the bottom of this page

**Requires**

Port Expander must be initialized. See Expander_Init.

Port Expander's PortB should be configured as an input. See Expander_Set_DirectionPortB and Expander_Set_DirectionPortAB routines.

**Example**

```c
// Read a byte from Port Expander's PORTB
char read_data;
...
Expander_Set_DirectionPortB(0,0xFF); // set expander's portb to be input
...
read_data = Expander_Read_PortB(0);
```
## Expander_Read_PortAB

### Prototype

```
unsigned int Expander_Read_PortAB(char ModuleAddress);
```

### Returns

Word read.

### Description

The function reads word from Port Expander's ports. PortA readings are in the higher byte of the result. PortB readings are in the lower byte of the result.

Parameters:

- `ModuleAddress`: Port Expander hardware address, see schematic at the bottom of this page

### Requires

Port Expander must be initialized. See Expander_Init.

Port Expander's PortA and PortB should be configured as inputs. See Expander_Set_DirectionPortA, Expander_Set_DirectionPortB and Expander_Set_DirectionPortAB routines.

### Example

```c
// Read a byte from Port Expander's PORTA and PORTB
unsigned int read_data;
...
Expander_Set_DirectionPortAB(0,0xFFFF);  // set expander's porta and portb to be input
...
read_data = Expander_Read_PortAB(0);
```

## Expander_Write_PortA

### Prototype

```
void Expander_Write_PortA(char ModuleAddress, char Data_);
```

### Returns

Nothing.

### Description

The function writes byte to Port Expander's PortA.

Parameters:

- `ModuleAddress`: Port Expander hardware address, see schematic at the bottom of this page
- `Data_`: data to be written

### Requires

Port Expander must be initialized. See Expander_Init.

Port Expander's PortA should be configured as output. See Expander_Set_DirectionPortA and Expander_Set_DirectionPortAB routines.

### Example

```c
// Write a byte to Port Expander's PORTA
...
Expander_Set_DirectionPortA(0,0x00);        // set expander's porta to be output
...
Expander_Write_PortA(0, 0xAA);
```
### Expander_Write_PortB

**Prototype**

```c
void Expander_Write_PortB(char ModuleAddress, char Data_);
```

**Returns**

Nothing.

**Description**

The function writes byte to Port Expander's PortB.

- **Parameters:**
  - `ModuleAddress`: Port Expander hardware address, see schematic at the bottom of this page
  - `Data`: data to be written

**Requires**

Port Expander must be initialized. See Expander_Init.

Port Expander's PortB should be configured as output. See Expander_Set_DirectionPortB and Expander_Set_DirectionPortAB routines.

**Example**

```c
// Write a byte to Port Expander's PORTB
...
Expander_Set_DirectionPortB(0,0x00);        // set expander's portb to be output
...
Expander_Write_PortB(0, 0x55);
```

### Expander_Write_PortAB

**Prototype**

```c
void Expander_Write_PortAB(char ModuleAddress, unsigned int Data_);
```

**Returns**

Nothing.

**Description**

The function writes word to Port Expander's ports.

- **Parameters:**
  - `ModuleAddress`: Port Expander hardware address, see schematic at the bottom of this page
  - `Data`: data to be written. Data to be written to PortA are passed in `Data`'s higher byte. Data to be written to PortB are passed in `Data`'s lower byte

**Requires**

Port Expander must be initialized. See Expander_Init.

Port Expander's PortA and PortB should be configured as outputs. See Expander_Set_DirectionPortA, Expander_Set_DirectionPortB and Expander_Set_DirectionPortAB routines.

**Example**

```c
// Write a byte to Port Expander's PORTA and PORTB
...
Expander_Set_DirectionPortAB(0,0x0000);        // set expander's porta and portb to be output
...
Expander_Write_PortAB(0, 0xAA55);
```
### Expander_Set_DirectionPortA

**Prototype**

```c
void Expander_Set_DirectionPortA(char ModuleAddress, char Data_);
```

**Returns**

Nothing.

**Description**

The function sets Port Expander's PortA direction.

Parameters:

- `ModuleAddress`: Port Expander hardware address, see schematic at the bottom of this page
- `Data`: data to be written to the PortA direction register. Each bit corresponds to the appropriate pin of the PortA register. Set bit configures the corresponding pin as an input. Cleared bit configures the corresponding pin as an output.

**Requires**

Port Expander must be initialized. See Expander_Init.

**Example**

```c
// Set Port Expander's PORTA to be output
Expander_Set_DirectionPortA(0,0x00);
```

### Expander_Set_DirectionPortB

**Prototype**

```c
void Expander_Set_DirectionPortB(char ModuleAddress, char Data_);
```

**Returns**

Nothing.

**Description**

The function sets Port Expander's PortB direction.

Parameters:

- `ModuleAddress`: Port Expander hardware address, see schematic at the bottom of this page
- `Data`: data to be written to the PortB direction register. Each bit corresponds to the appropriate pin of the PortB register. Set bit configures the corresponding pin as an input. Cleared bit configures the corresponding pin as an output.

**Requires**

Port Expander must be initialized. See Expander_Init.

**Example**

```c
// Set Port Expander's PORTB to be input
Expander_Set_DirectionPortB(0,0xFF);
```
### Expander_Set_DirectionPortAB

**Prototype**

```c
void Expander_Set_DirectionPortAB(char ModuleAddress, unsigned int Direction);
```

**Returns**

Nothing.

**Description**

The function sets Port Expander's PortA and PortB direction.

Parameters:

- `ModuleAddress`: Port Expander hardware address, see schematic at the bottom of this page
- `Direction`: data to be written to direction registers. Data to be written to the PortA direction register are passed in `Direction`'s higher byte. Data to be written to the PortB direction register are passed in `Direction`'s lower byte. Each bit corresponds to the appropriate pin of the PortA/PortB register. Set bit configures the corresponding pin as an input. Cleared bit configures the corresponding pin as an output.

**Requires**

Port Expander must be initialized. See Expander_Init.

**Example**

```c
// Set Port Expander's PORTA to be output and PORTB to be input
Expander_Set_DirectionPortAB(0, 0x00FF);
```

### Expander_Set_PullUpsPortA

**Prototype**

```c
void Expander_Set_PullUpsPortA(char ModuleAddress, char Data_);
```

**Returns**

Nothing.

**Description**

The function sets Port Expander's PortA pull up/down resistors.

Parameters:

- `ModuleAddress`: Port Expander hardware address, see schematic at the bottom of this page
- `Data`: data for choosing pull up/down resistors configuration. Each bit corresponds to the appropriate pin of the PortA register. Set bit enables pull-up for corresponding pin.

**Requires**

Port Expander must be initialized. See Expander_Init.

**Example**

```c
// Set Port Expander's PORTA pull-up resistors
Expander_Set_PullUpsPortA(0, 0xFF);
```
## Expander_Set_PullUpsPortB

**Prototype**

```c
void Expander_Set_PullUpsPortB(char ModuleAddress, char Data_);
```

**Returns**

Nothing.

**Description**

The function sets Port Expander's PortB pull up/down resistors.

- **Parameters:**
  - `ModuleAddress`: Port Expander hardware address, see schematic at the bottom of this page
  - `Data`: data for choosing pull up/down resistors configuration. Each bit corresponds to the appropriate pin of the PortB register. Set bit enables pull-up for corresponding pin.

**Requires**

Port Expander must be initialized. See Expander_Init.

**Example**

```c
// Set Port Expander's PORTB pull-up resistors
Expander_Set_PullUpsPortB(0, 0xFF);
```

---

## Expander_Set_PullUpsPortAB

**Prototype**

```c
void Expander_Set_PullUpsPortAB(char ModuleAddress, unsigned int PullUps);
```

**Returns**

Nothing.

**Description**

The function sets Port Expander's PortA and PortB pull up/down resistors.

- **Parameters:**
  - `ModuleAddress`: Port Expander hardware address, see schematic at the bottom of this page
  - `PullUps`: data for choosing pull up/down resistors configuration. PortA pull up/down resistors configuration is passed in `PullUps`'s higher byte. PortB pull up/down resistors configuration is passed in `PullUps`'s lower byte. Each bit corresponds to the appropriate pin of the PortA/PortB register. Set bit enables pull-up for corresponding pin.

**Requires**

Port Expander must be initialized. See Expander_Init.

**Example**

```c
// Set Port Expander's PORTA and PORTB pull-up resistors
Expander_Set_PullUpsPortAB(0, 0xFFFF);
```
Library Example

The example demonstrates how to communicate with Port Expander MCP23S17. Note that Port Expander pins A2 A1 A0 are connected to GND so Port Expander Hardware Address is 0.

```c
// Port Expander module connections
sbit SPExpanderRST at RC0_bit;
sbit SPExpanderCS at RC1_bit;
sbit SPExpanderRST_Direction at TRISC0_bit;
sbit SPExpanderCS_Direction at TRISC1_bit;
// End Port Expander module connections

unsigned char i = 0;

void main() {
    ANSEL = 0;              // Configure AN pins as digital I/O
    ANSELH = 0;
    TRISB = 0;               // Set PORTB as output
    PORTB = 0xFF;

    // If Port Expander Library uses SPI1 module
    SPI1_Init();  // Initialize SPI module used with PortExpander

    // If Port Expander Library uses SPI2 module
    // SPI2_Init();  // Initialize SPI module used with PortExpander

    Expander_Init(0);         // Initialize Port Expander

    Expander_Set_DirectionPortA(0, 0x00);  // Set Expander's PORTA to be output

    Expander_Set_DirectionPortB(0,0xFF); // Set Expander's PORTB to be input
    Expander_Set_PullUpsPortB(0,0xFF);  // Set pull-ups to all of the Expander's PORTB pins

    while(1) {                // Endless loop
        Expander_Write_PortA(0, i++);  // Write i to expander's PORTA
        PORTB = Expander_Read_PortB(0);  // Read expander's PORTB and write it to LEDs
        Delay_ms(100);
    }
}
```

Port Expander HW connection
PS/2 LIBRARY

The *mikroC PRO for PIC* provides a library for communication with the common PS/2 keyboard.

**Note:** The library does not utilize interrupts for data retrieval, and requires the oscillator clock to be at least 6MHz.

**Note:** The pins to which a PS/2 keyboard is attached should be connected to the pull-up resistors.

**Note:** Although PS/2 is a two-way communication bus, this library does not provide MCU-to-keyboard communication; e.g. pressing the Caps Lock key will not turn on the Caps Lock LED.

External dependencies of PS/2 Library

### Ps2_Key_Read

<table>
<thead>
<tr>
<th>Prototype</th>
<th>\textbf{unsigned short} \textbf{Ps2_Key_Read}(\textbf{unsigned short} *\textbf{value}, \textbf{unsigned short} *\textbf{special}, \textbf{unsigned short} *\textbf{pressed});</th>
</tr>
</thead>
</table>
| Returns   | - 1 if reading of a key from the keyboard was successful  
- 0 if no key was pressed |
| Description | The function retrieves information on key pressed.  
Parameters:  
- \textbf{value}: holds the value of the key pressed. For characters, numerals,  
punctuation marks, and space \textbf{value} will store the appropriate ASCII code. Routine “recognizes” the function of Shift and Caps Lock, and behaves appropriately. For special function keys see Special Function Keys Table.  
- \textbf{special}: is a flag for special function keys (F1, Enter, Esc, etc). If key pressed is one of these, \textbf{special} will be set to 1, otherwise 0.  
- \textbf{pressed}: is set to 1 if the key is pressed, and 0 if it is released. |
| Requires  | PS/2 keyboard needs to be initialized. See Ps2\_Config routine. |
| Example   | \begin{verbatim}
unsigned short keydata = 0, special = 0, down = 0;
...  // Press Enter to continue:
do {
  if (Ps2\_Key\_Read(&keydata, &special, &down)) {
    if (down && (keydata == 16)) break;
  }
} while (1);
\end{verbatim} |

Library Example

This simple example reads values of the pressed keys on the PS/2 keyboard and sends them via UART.

```c
unsigned short keydata = 0, special = 0, down = 0;

sbit PS2_Data at RC0_bit;
sbit PS2_Clock at RC1_bit;
sbit PS2_Data_Direction at TRISC0_bit;
sbit PS2_Clock_Direction at TRISC1_bit;

void main() {
    ANSEL  = 0;          // Configure AN pins as digital I/O
    ANSELH = 0;

    UART1_Init(19200);     // Initialize UART module at 19200 bps
    Ps2_Config();         // Init PS/2 Keyboard
    Delay_ms(100);         // Wait for keyboard to finish
    UART1_Write_Text("Ready");

    do {
        if (Ps2_Key_Read(&keydata, &special, &down)) {
            if (down && (keydata == 16)) {// Backspace
                UART1_Write(0x08);
            }
            else if (down && (keydata == 13)) {// Enter
                UART1_Write('r'); // send carriage return to usart terminal
                //Usart_Write('n'); // uncomment this line if usart terminal also expects line feed
                // for new line transition
            }
            else if (down && !special && keydata) {
                UART1_Write(keydata);
            }
        }
        Delay_ms(1);
    } while (1);
}
```
HW Connection

Example of PS2 keyboard connection
PWM LIBRARY

CCP module is available with a number of PIC MCUs. *mikroC PRO for PIC* provides library which simplifies using PWM HW Module.

**Note:** Some MCUs have multiple CCP modules. In order to use the desired CCP library routine, simply change the number 1 in the prototype with the appropriate module number, i.e. `PWM2_Start();`

**Library Routines**

- PWM1_Init
- PWM1_Set_Duty
- PWM1_Start
- PWM1_Stop

**PWM1_Init**

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void PWM1_Init(long freq);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Initializes the PWM module with duty ratio 0. Parameter <code>freq</code> is a desired PWM frequency in Hz (refer to device data sheet for correct values in respect with Fosc).</td>
</tr>
<tr>
<td>Requires</td>
<td>MCU must have CCP module.</td>
</tr>
<tr>
<td>Example</td>
<td>Initialize PWM module at 5KHz:</td>
</tr>
<tr>
<td></td>
<td><code>PWM1_Init(5000);</code></td>
</tr>
</tbody>
</table>

**Note:** Calculation of the PWM frequency value is carried out by the compiler, as it would produce a relatively large code if performed on the library level. Therefore, compiler needs to know the value of the parameter in the compile time. That is why this parameter needs to be a constant, and not a variable.
### PWM1_Set_Duty

**Prototype**  
```c
void PWM1_Set_Duty(unsigned short duty_ratio);
```

**Returns**  
Nothing.

**Description**  
Sets PWM duty ratio. Parameter `duty` takes values from 0 to 255, where 0 is 0%, 127 is 50%, and 255 is 100% duty ratio. Other specific values for duty ratio can be calculated as \((\text{Percent} \times 255)/100\).

**Requires**  
MCU must have CCP module. PWM1_Init must be called before using this routine.

**Example**  
Set duty ratio to 75%:
```
PWM1_Set_Duty(192);
```

### PWM1_Start

**Prototype**  
```c
void PWM1_Start(void);
```

**Returns**  
Nothing.

**Description**  
Starts PWM.

**Requires**  
MCU must have CCP module. PWM1_Init must be called before using this routine.

**Example**  
```
PWM1_Start();
```

### PWM1_Stop

**Prototype**  
```c
void PWM1_Stop(void);
```

**Returns**  
Nothing.

**Description**  
Starts PWM.

**Requires**  
MCU must have CCP module. PWM1_Init must be called before using this routine. PWM1_Start should be called before using this routine, otherwise it will have no effect as the PWM module is not running.

**Example**  
```
PWM1_Stop();
```
Library Example

The example changes PWM duty ratio on RC1 and RC2 pins continually. If LED is connected to these pins, you can observe the gradual change of emitted light.

```c
unsigned short current_duty, old_duty, current_duty1, old_duty1;

void InitMain() {
    ANSEL = 0;          // Configure AN pins as digital I/O
    ANSELH = 0;
    PORTA = 255;
    TRISA = 255;        // configure PORTA pins as input
    PORTB = 0;          // set PORTB to 0
    TRISB = 0;          // designate PORTB pins as output
    PORTC = 0;          // set PORTC to 0
    TRISC = 0;          // designate PORTC pins as output
    PWM1_Init(5000);    // Initialize PWM1 module at 5KHz
    PWM2_Init(5000);    // Initialize PWM2 module at 5KHz
}

void main() {
    InitMain();
    current_duty = 16;   // initial value for current_duty
    current_duty1 = 16;  // initial value for current_duty1
    PWM1_Start();        // start PWM1
    PWM2_Start();        // start PWM2
    PWM1_Set_Duty(current_duty);  // Set current duty for PWM1
    PWM2_Set_Duty(current_duty1); // Set current duty for PWM2

    while (1) {            // endless loop
        if (RA0_bit) {      // button on RA0 pressed
            Delay_ms(40);
            current_duty++;      // increment current_duty
            PWM1_Set_Duty(current_duty);
        }

        if (RA1_bit) {      // button on RA1 pressed
            Delay_ms(40);
            current_duty--;      // decrement current_duty
            PWM1_Set_Duty(current_duty);
        }

        if (RA2_bit) {      // button on RA2 pressed
            Delay_ms(40);
            current_duty1++;     // increment current_duty1
            PWM2_Set_Duty(current_duty1);
        }
    }
}
```
if (RA3_bit) { // button on RA3 pressed
    Delay_ms(40);
    current_duty1--; // decrement current_duty1
    PWM2_Set_Duty(current_duty1);
}

    Delay_ms(5); // slow down change pace a little
}

HW Connection

![PWM demonstration diagram]
RS-485 LIBRARY

RS-485 is a multipoint communication which allows multiple devices to be connected to a single bus. The *mikroC PRO for PIC* provides a set of library routines for comfortable work with RS485 system using Master/Slave architecture. Master and Slave devices interchange packets of information. Each of these packets contains synchronization bytes, CRC byte, address byte and the data. Each Slave has unique address and receives only packets addressed to it. The Slave can never initiate communication. It is the user’s responsibility to ensure that only one device transmits via 485 bus at a time. The RS-485 routines require the UART module. Pins of UART need to be attached to RS-485 interface transceiver, such as LTC485 or similar (see schematic at the bottom of this page).

**Note:** The library uses the UART module for communication. The user must initialize the appropriate UART module before using the RS-485 Library. For MCUs with two UART modules it is possible to initialize both of them and then switch by using the `UART_Set_Active` function. See the UART Library functions.

**Library constants:**

- START byte value = 150
- STOP byte value = 169
- Address 50 is the broadcast address for all Slaves (packets containing address 50 will be received by all Slaves except the Slaves with addresses 150 and 169).

**Note:** Since some PIC18 MCUs have multiple UART modules, appropriate UART module must be initialized. Switching between UART modules in the UART library is done by the `UART_Set_Active` function (UART module has to be previously initialized).

</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RS485_rxtx_pin - this pin is connected to RE/DE input of RS-485 transceiver (see schematic at the bottom of this page). RE/DE signal controls RS-485 transceiver operation mode.</td>
</tr>
<tr>
<td></td>
<td>RS485_rxtx_pin_direction - direction of the RS-485 Transmit/Receive pin must be defined before using this function.</td>
</tr>
<tr>
<td></td>
<td>UART HW module needs to be initialized. See UART1_Init.</td>
</tr>
</tbody>
</table>

Example

```c
// RS485 module pinout
sbit RS485_rxtx_pin_direction at RC2_bit; // transmit/receive control set to PORTC.B2

// Pin direction
sbit RS485_rxtx_pin_direction at TRISC2_bit; // RxD/TxD pin direction set as output

... UART1_Init(9600); // initialize UART module
RS485Master_Init(); // initialize MCU as a Master for RS-485 communication
```
## RS485Master_Send

**Prototype**

```c
void RS485Master_Send(char *data_buffer, char datalen, char Slave_address);
```

**Returns**

Nothing.

**Description**

Sends message to Slave(s). Message format can be found at the bottom of this page.

**Parameters:**

- `data_buffer`: data to be sent
- `datalen`: number of bytes for transmission. Valid values: 0...3.
- `Slave_address`: Slave(s) address

**Requires**

MCU must be initialized as a Master for RS-485 communication. See RS485Master_Init.

**Example**

```c
char msg[8];
...
RS485Master_Send(msg, 3, 0x12);
```

## RS485Master_Receive

**Prototype**

```c
void RS485Master_Receive(char *data_buffer);
```

**Returns**

Nothing.

**Description**

Receives messages from Slaves. Messages are multi-byte, so this routine must be called for each byte received.

**Parameters:**

- `data_buffer`: 7 byte buffer for storing received data, in the following manner:
  - `data[0..2]`: message content
  - `data[3]`: number of message bytes received, 1–3
  - `data[4]`: is set to 255 when message is received
  - `data[5]`: is set to 255 if error has occurred
  - `data[6]`: address of the Slave which sent the message

The function automatically adjusts `data[4]` and `data[5]` upon every received message. These flags need to be cleared by software.

**Requires**

MCU must be initialized as a Master for RS-485 communication. See RS485Master_Init.

**Example**

```c
char msg[8];
...
RS485Master_Receive(msg);
```
### RS485Slave_Init

<table>

</tr>
<tr>
<td>Requires UART HW module needs to be initialized. See UART1_Init.</td>
<td></td>
</tr>
</tbody>
</table>

#### Example

```c
// RS485 module pinout
sbit RS485_rxtx_pin at RC2_bit;       // transmit/receive control
  set to PORTC.B2

// Pin direction
sbit RS485_rxtx_pin_direction at TRISC2_bit; // RxD/TxD pin direction set as output

... UART1_Init(9600);                    // initialize UART module
RS485Slave_Init(160);                  // initialize MCU as a Slave
for RS-485 communication with address 160
```
### RS485slave_Receive

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void RS485Slave_Receive(char *data_buffer);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
</tbody>
</table>
| Description     | Receives messages from Master. If Slave address and Message address field don't match then the message will be discarded. Messages are multi-byte, so this routine must be called for each byte received.  
Oracle:  
- `data_buffer`: 6 byte buffer for storing received data, in the following manner:  
  - `data[0..2]`: message content  
  - `data[3]`: number of message bytes received, 1–3  
  - `data[4]`: is set to 255 when message is received  
  - `data[5]`: is set to 255 if error has occurred  
Oracle:  
The function automatically adjusts `data[4]` and `data[5]` upon every received message. These flags need to be cleared by software.  |
| Requires        | MCU must be initialized as a Slave for RS-485 communication. See RS485slave_Init. |
| Example         | `char msg[8];`  
Oracle:  
`...`  
`RS485Slave_Read(msg);`
RS485slave_Send

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void RS485slave_Send(char *data_buffer, char datalen);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Sends message to Master. Message format can be found at the bottom of this page.</td>
</tr>
</tbody>
</table>
| Description | Parameters:  
- data_buffer: data to be sent  
- datalen: number of bytes for transmission. Valid values: 0...3. |
| Requires  | MCU must be initialized as a Slave for RS-485 communication. See RS485slave_Init. It is the user’s responsibility to ensure (by protocol) that only one device sends data via 485 bus at a time. |
| Example   | char msg[8];  
...  
// send 2 bytes of data to the Master  
RS485Slave_Send(msg, 2); |

Library Example

This is a simple demonstration of RS485 Library routines usage.

Master sends message to Slave with address 160 and waits for a response. The Slave accepts data, increments it and sends it back to the Master. Master then does the same and sends incremented data back to Slave, etc.

Master displays received data on PORTB, while error on receive (0xAA) and number of consecutive unsuccessful retries are displayed on PORTD. Slave displays received data on PORTB, while error on receive (0xAA) is displayed on PORTD. Hardware configurations in this example are made for the EasyPIC5 board and 16F887.
RS485 Master code:

```c
char dat[10]; // buffer for receiving/sending messages
char i,j;

sbit rs485_rxtx_pin at RC2_bit; // set transceive pin
sbit rs485_rxtx_pin_direction at TRISC2_bit; // set transceive pin direction

// Interrupt routine
void interrupt() {
    RS485Master_Receive(dat);
}

void main(){
    long cnt = 0;

    ANSEL = 0; // Configure AN pins as digital I/O
    ANSELH = 0;

    PORTB = 0;
    PORTD = 0;
    TRISB = 0;
    TRISD = 0;

    UART1_Init(9600); // initialize UART1 module
    Delay_ms(100);

    RS485Master_Init(); // initialize MCU as Master
    dat[ 0] = 0xAA;
    dat[ 1] = 0xF0;
    dat[ 2] = 0x0F;
    dat[ 4] = 0; // ensure that message received flag is 0
    dat[ 5] = 0; // ensure that error flag is 0
    dat[ 6] = 0;

    RS485Master_Send(dat,1,160);

    PIE1.RCIE = 1; // enable interrupt on UART1 receive
    PIE2.TXIE = 0; // disable interrupt on UART1 transmit
    INTCON.PEIE = 1; // enable peripheral interrupts
    INTCON.GIE = 1; // enable all interrupts

    while (1){
        cnt++;
        // upon completed valid message receiving
        // data[4] is set to 255
    }
```
```c
if (dat[5]) { // if an error detected, signal it
    PORTD = 0xAA; // by setting portd to 0xAA
}
if (dat[4]) { // if message received successfully
    cnt = 0;
    dat[4] = 0; // clear message received flag
    j = dat[3];
    for (i = 1; i <= dat[3]; i++) { // show data on PORTB
        PORTB = dat[i-1];
    } // increment received dat[0]
    dat[0] = dat[0]+1; // send back to master
    Delay_ms(1);
    RS485Master_Send(dat,1,160);
}
if (cnt > 100000) {
    PORTD ++;
    cnt = 0;
    RS485Master_Send(dat,1,160);
    if (PORTD > 10) // if sending failed 10 times
        RS485Master_Send(dat,1,50); // send message on broadcast address
}
} // function to be properly linked.

RS485 Slave code:

char dat[9]; // buffer for receiving/sending messages
char i,j;

sbit rs485_rxtx_pin at RC2_bit; // set transmit/receive pin
sbit rs485_rxtx_pin_direction at TRISC2_bit; // set transmit/receive pin direction

// Interrupt routine
void interrupt() {
    RS485Slave.Receive(dat);
}

void main() {
    ANSEL = 0; // Configure AN pins as digital I/O
    ANSELH = 0;
    PORTB = 0;
    PORTD = 0;
    TRISB = 0;
    TRISD = 0;
```
UART1_Init(9600); // initialize UART1 module
Delay_ms(100);
RS485Slave_Init(160); // Initialize MCU as slave, address 160

dat[4] = 0; // ensure that message received flag is 0
dat[5] = 0; // ensure that message received flag is 0
dat[6] = 0; // ensure that error flag is 0

PIE1.RCIE = 1; // enable interrupt on UART1 receive
PIE2.TXIE = 0; // disable interrupt on UART1 transmit
INTCON.PEIE = 1; // enable peripheral interrupts
INTCON.GIE = 1; // enable all interrupts

while (1) {
    if (dat[5]) { // if an error detected, signal it by
        PORTD = 0xAA; // setting portd to 0xAA
        dat[5] = 0;
    }
    if (dat[4]) { // upon completed valid message receive
        dat[4] = 0; // data[4] is set to 0xFF
        j = dat[3];
        for (i = 1; i <= dat[3]; i++){
            PORTB = dat[i-1];
        }
        dat[0] = dat[0]+1; // increment received dat[0]
        Delay_ms(1);
        RS485Slave_Send(dat,1); // and send it back to master
    }
}
}
Example of interfacing PC to 8051 MCU via RS485 bus with LTC485 as RS-485 transceiver
**Message format and CRC calculations**

**Q:** How is CRC checksum calculated on RS485 Master side?

```
START_BYTE = 0x96; // 10010110
STOP_BYTE = 0xA9; // 10101001

PACKAGE:
--------
START_BYTE 0x96
ADDRESS
DATALEN
[ DATA1]  // if exists
[ DATA2]  // if exists
[ DATA3]  // if exists
CRC
STOP_BYTE 0xA9

DATALEN bits
------------
bit7 = 1  MASTER SENDS
0  SLAVE SENDS
bit6 = 1  ADDRESS WAS XORed with 1, IT WAS EQUAL TO START_BYTE or
STOP_BYTE
0  ADDRESS UNCHANGED
bit5 = 0  FIXED
bit4 = 1  DATA3 (if exists) WAS XORed with 1, IT WAS EQUAL TO
START_BYTE or STOP_BYTE
0  DATA3 (if exists) UNCHANGED
bit3 = 1  DATA2 (if exists) WAS XORed with 1, IT WAS EQUAL TO
START_BYTE or STOP_BYTE
0  DATA2 (if exists) UNCHANGED
bit2 = 1  DATA1 (if exists) WAS XORed with 1, IT WAS EQUAL TO
START_BYTE or STOP_BYTE
0  DATA1 (if exists) UNCHANGED
bit1bit0 = 0 to 3 NUMBER OF DATA BYTES SEND

CRC generation :
----------------
crc_send = datalen ^ address;
crc_send ^= data[0];  // if exists
crc_send ^= data[1];  // if exists
crc_send ^= data[2];  // if exists
crc_send = ~cyc_send;
if ((cyc_send == START_BYTE) || (cyc_send == STOP_BYTE))
    crc_send++;
```

**NOTE:** DATALEN<4..0> can not take the START_BYTE<4..0> or STOP_BYTE<4..0> values.
SOFTWARE I²C LIBRARY

The *mikroC PRO for PIC* provides routines for implementing Software I²C communication. These routines are hardware independent and can be used with any MCU. The Software I²C library enables you to use MCU as Master in I²C communication. Multi-master mode is not supported.

**Note:** This library implements time-based activities, so interrupts need to be disabled when using Software I²C.

**Note:** All Software I²C Library functions are blocking-call functions (they are waiting for I²C clock line to become logical one).

**Note:** The pins used for the Software I²C communication should be connected to the pull-up resistors. Turning off the LEDs connected to these pins may also be required.

**External dependencies of Soft_I2C Library**

<table>

</tbody>
</table>

**Library Routines**

- Soft_I2C_Init
- Soft_I2C_Start
- Soft_I2C_Read
- Soft_I2C_Write
- Soft_I2C_Stop
- Soft_I2C_Break
### Soft_I2C_Init

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void Soft_I2C_Init();</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Configures the software I2C module.</td>
</tr>
</tbody>
</table>

**Requires**

- `Soft_I2C_Scl`: Soft I2C clock line
- `Soft_I2C_Sda`: Soft I2C data line
- `Soft_I2C_Scl_Pin_Direction`: Direction of the Soft I2C clock pin
- `Soft_I2C_Sda_Pin_Direction`: Direction of the Soft I2C data pin

*must be defined before using this function.*

**Example**

```c
// Software I2C connections
sbit Soft_I2C_Scl at RC3_bit;
sbit Soft_I2C_Sda at RC4_bit;
sbit Soft_I2C_Scl_Direction at TRISC3_bit;
sbit Soft_I2C_Sda_Direction at TRISC4_bit;
// End Software I2C connections
...
Soft_I2C_Init();
```

### Soft_I2C_Start

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void Soft_I2C_Start(void);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Determines if the I2C bus is free and issues START signal.</td>
</tr>
</tbody>
</table>

**Requires**

Software I2C must be configured before using this function. See `Soft_I2C_Init` routine.

**Example**

```c
// Issue START signal
Soft_I2C_Start();
```
### Soft_I2C_Read

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned short Soft_I2C_Read(unsigned int ack);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>One byte from the Slave.</td>
</tr>
<tr>
<td>Description</td>
<td>Reads one byte from the slave.</td>
</tr>
<tr>
<td>Parameters:</td>
<td>- <code>ack</code>: acknowledge signal parameter. If the <code>ack==0</code> not <code>acknowledge</code> signal will be sent after reading, otherwise the <code>acknowledge</code> signal will be sent.</td>
</tr>
<tr>
<td>Requires</td>
<td>Soft I2C must be configured before using this function. See Soft_I2C_Init routine. Also, START signal needs to be issued in order to use this function. See Soft_I2C_Start routine.</td>
</tr>
</tbody>
</table>
| Example              | `unsigned short take;`  
|                      | `...`  
|                      | `// Read data and send the not_acknowledge signal`  
|                      | `take = Soft_I2C_Read(0);` |

### Soft_I2C_Write

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned short Soft_I2C_Write(unsigned short Data_);</code></th>
</tr>
</thead>
</table>
| Returns              | - 0 if there were no errors.  
|                      | - 1 if write collision was detected on the I2C bus. |
| Description          | Sends data byte via the I2C bus.                  |
| Parameters:          | - `Data`: data to be sent                         |
| Requires             | Soft I2C must be configured before using this function. See Soft_I2C_Init routine. Also, START signal needs to be issued in order to use this function. See Soft_I2C_Start routine. |
| Example              | `unsigned short data, error;`  
|                      | `...`  
|                      | `error = Soft_I2C_Write(data);`  
|                      | `error = Soft_I2C_Write(0xA3);` |
### Soft_I2C_Stop

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void Soft_I2C_Stop(void);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Issues STOP signal.</td>
</tr>
<tr>
<td>Requires</td>
<td>Soft I(^2)C must be configured before using this function. See Soft_I2C_Init routine.</td>
</tr>
</tbody>
</table>
| Example            | // Issue STOP signal  
|                    | Soft_I2C_Stop();           |

### Soft_I2C_Break

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void Soft_I2C_Break(void);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
</tbody>
</table>
| Description        | All Software I\(^2\)C Library functions can block the program flow (see note at the top of this page). Calling this routine from interrupt will unblock the program execution. This mechanism is similar to WDT.  
| Note               | Interrupts should be disabled before using Software I\(^2\)C routines again (see note at the top of this page). |
| Requires           | Nothing.                   |
| Example            | // Software I2C connections  
|                    | sbit Soft_I2C_Scl at RC0_bit;  
|                    | sbit Soft_I2C_Sda at RC1_bit;  
|                    | sbit Soft_I2C_Scl_Direction at TRISC0_bit;  
|                    | sbit Soft_I2C_Sda_Direction at TRISC1_bit;  
|                    | // End Software I2C connections  
|                    | char counter = 0;  
|                    | void interrupt {  
|                    |     if (INTCON.T0IF) {  
|                    |         if (counter >= 20) {  
|                    |             Soft_I2C_Break();  
|                    |             counter = 0; // reset counter  
|                    |         }  
|                    |     }  
|                    |     else  
|                    |         counter++; // increment counter  
|                    |     INTCON.T0IF = 0; // Clear Timer0 overflow interrupt flag  
                    | }   |
Library Example

The example demonstrates Software I_C Library routines usage. The PIC MCU is connected (SCL, SDA pins) to PCF8583 RTC (real-time clock). Program reads date and time are read from the RTC and prints it on Lcd.

```c
char seconds, minutes, hours, day, month, year;    // Global date/time variables

// Software I2C connections
sbit Soft_I2C_SCL at RC3_bit;
sbit Soft_I2C_SDA at RC4_bit;
sbit Soft_I2C_SCL_Direction at TRISC3_bit;
sbit Soft_I2C_SDA_Direction at TRISC4_bit;
// End Software I2C connections

// LCD module connections
sbit LCD_RS at RB4_bit;
sbit LCD_EN at RB5_bit;
sbit LCD_D4 at RB0_bit;
sbit LCD_D5 at RB1_bit;
sbit LCD_D6 at RB2_bit;
sbit LCD_D7 at RB3_bit;

sbit LCD_RS_Direction at TRISB4_bit;
sbit LCD_EN_Direction at TRISB5_bit;
sbit LCD_D4_Direction at TRISB0_bit;
```
```c
sbit LCD_D5_Direction at TRISB1_bit;
sbit LCD_D6_Direction at TRISB2_bit;
sbit LCD_D7_Direction at TRISB3_bit;
// End LCD module connections

//---------------------- Reads time and date information from RTC (PCF8583)
void Read_Time() {
    Soft_I2C_Start(); // Issue start signal
    Soft_I2C_Write(0xA0); // Address PCF8583, see PCF8583 datasheet
    Soft_I2C_Write(2); // Start from address 2
    Soft_I2C_Start(); // Issue repeated start signal
    Soft_I2C_Write(0xA1); // Address PCF8583 for reading R/W=1

    seconds = Soft_I2C_Read(1); // Read seconds byte
    minutes = Soft_I2C_Read(1); // Read minutes byte
    hours = Soft_I2C_Read(1); // Read hours byte
    day = Soft_I2C_Read(1); // Read year/day byte
    month = Soft_I2C_Read(0); // Read weekday/month byte
    Soft_I2C_Stop(); // Issue stop signal
}

//---------------------- Formats date and time
void Transform_Time() {
    seconds = ((seconds & 0xF0) >> 4)*10 + (seconds & 0x0F); // Transform seconds
    minutes = ((minutes & 0xF0) >> 4)*10 + (minutes & 0x0F); // Transform minutes
    hours = ((hours & 0xF0) >> 4)*10 + (hours & 0x0F); // Transform hours
    year = (day & 0xC0) >> 6; // Transform year
    day = ((day & 0x30) >> 4)*10 + (day & 0x0F); // Transform day
    month = ((month & 0x10) >> 4)*10 + (month & 0x0F); // Transform month
}

//---------------------- Output values to LCD
void Display_Time() {
    Lcd_Chr(1, 6, (day / 10) + 48); // Print tens digit of day variable
    Lcd_Chr(1, 7, (day % 10) + 48); // Print ones digit of day variable
    Lcd_Chr(1, 9, (month / 10) + 48);
    Lcd_Chr(1, 10, (month % 10) + 48);
    Lcd_Chr(1, 15, year + 56); // Print year variable + 8
}
(start from year 2008)

Lcd_Chr(2, 6, (hours / 10) + 48);
Lcd_Chr(2, 7, (hours % 10) + 48);
Lcd_Chr(2, 9, (minutes / 10) + 48);
Lcd_Chr(2,10, (minutes % 10) + 48);
Lcd_Chr(2,12, (seconds / 10) + 48);
Lcd_Chr(2,13, (seconds % 10) + 48);
}

//------------------ Performs project-wide init
void Init_Main() {

TRISB = 0;
PORTB = 0xFF;
TRISB = 0xff;
ANSEL  = 0;  // Configure AN pins as digital I/O
ANSELH = 0;
Soft_I2C_Init(); // Initialize Soft I2C communication
Lcd_Init();    // Initialize LCD
Lcd_Cmd(_LCD_CLEAR);  // Clear LCD display
Lcd_Cmd(_LCD_CURSOR_OFF);  // Turn cursor off

Lcd_Out(1,1,"Date:");  // Prepare and output static text on LCD
Lcd_Chr(1,8,':' );
Lcd_Chr(1,11,':' );
Lcd_Out(2,1,"Time:");
Lcd_Chr(2,8,':' );
Lcd_Chr(2,11,':' );
Lcd_Out(1,12,"200");
}

//----------------- Main procedure
void main() {

Delay_ms(2000);

Init_Main();  // Perform initialization

while (1) {  // Endless loop
    Read_Time();  // Read time from RTC(PCF8583)
    Transform_Time();  // Format date and time
    Display_Time();  // Prepare and display on LCD
    Delay_ms(1000);  // Wait 1 second
}
}
SOFTWARE SPI LIBRARY

The mikroC PRO for PIC provides routines for implementing Software SPI communication. These routines are hardware independent and can be used with any MCU. The Software SPI Library provides easy communication with other devices via SPI: A/D converters, D/A converters, MAX7219, LTC1290, etc.

Library configuration:

- SPI to Master mode
- Clock value = 20 kHz.
- Data sampled at the middle of interval.
- Clock idle state low.
- Data sampled at the middle of interval.
- Data transmitted at low to high edge.

Note: The Software SPI library implements time-based activities, so interrupts need to be disabled when using it.

External dependencies of Software SPI Library

<table>
<thead>
<tr>
<th>The following variables must be defined in all projects using Software SPI Library:</th>
<th>Description:</th>
<th>Example:</th>
</tr>
</thead>
<tbody>
<tr>
<td>extern sfr sbit SoftSpi_SDI;</td>

### Library Routines

- `Soft_Spi_Init`
- `Soft_Spi_Read`
- `Soft_Spi_Write`

#### Soft_Spi_Init

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void Soft_SPI_Init();</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Configures and initializes the software SPI module.</td>
</tr>
</tbody>
</table>

**Requires**

Global variables:

- `Chip_Select`: Chip Select line
- `SoftSpi_SDI`: Data in line
- `SoftSpi_SDO`: Data out line
- `SoftSpi_CLK`: Data clock line
- `Chip_Select_Direction`: Direction of the Chip Select pin
- `SoftSpi_SDI_Direction`: Direction of the Data in pin
- `SoftSpi_SDO_Direction`: Direction of the Data out pin
- `SoftSpi_CLK_Direction`: Direction of the Data clock pin

must be defined before using this function.

**Example**

```c
// Software SPI module connections
sbit Chip_Select at RC0_bit;
sbit SoftSpi_SDI at RC4_bit;
sbit SoftSpi_SDO at RC5_bit;
sbit SoftSpi_CLK at RC3_bit;

sbit Chip_Select_Direction at TRISC0_bit;
sbit SoftSpi_SDI_Direction at TRISC4_bit;
sbit SoftSpi_SDO_Direction at TRISC5_bit;
sbit SoftSpi_CLK_Direction at TRISC3_bit;

// End Software SPI module connections
...
Soft_SPI_Init(); // Init Soft_SPI
```
### Soft_Spi_Read

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned short Soft_SPI_Read(char sdata);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Byte received via the SPI bus.</td>
</tr>
<tr>
<td>Description</td>
<td>This routine performs 3 operations simultaneously. It provides clock for the Software SPI bus, reads a byte and sends a byte.</td>
</tr>
<tr>
<td>Parameters:</td>
<td></td>
</tr>
<tr>
<td><code>sdata</code></td>
<td>data to be sent.</td>
</tr>
<tr>
<td>Requires</td>
<td>Soft SPI must be initialized before using this function. See Soft_SPI_Init routine.</td>
</tr>
</tbody>
</table>
| Example         | ```c  
    unsigned short data_read;
    char data_send;
    ...
    // Read a byte and assign it to data_read variable
    // (data_send byte will be sent via SPI during the Read operation)
    data_read = Soft_SPI_Read(data_send);
``` |

### Soft_SPI_Write

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void Soft_SPI_Write(char sdata);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>This routine sends one byte via the Software SPI bus.</td>
</tr>
<tr>
<td>Parameters:</td>
<td><code>sdata</code>: data to be sent.</td>
</tr>
<tr>
<td>Requires</td>
<td>Soft SPI must be initialized before using this function. See Soft_SPI_Init routine.</td>
</tr>
</tbody>
</table>
| Example         | ```c  
    // Write a byte to the Soft SPI bus
    Soft_SPI_Write(0xAA);
``` |
Library Example

This code demonstrates using library routines for Soft_SPI communication. Also, this example demonstrates working with Microchip's MCP4921 12-bit D/A converter.

```c
// DAC module connections
sbit Chip_Select at RC0_bit;
sbit SoftSpi_CLK at RC3_bit;
sbit SoftSpi_SDI at RC4_bit;
sbit SoftSpi_SDO at RC5_bit;

sbit Chip_Select_Direction at TRISC0_bit;
sbit SoftSpi_CLK_Direction at TRISC3_bit;
sbit SoftSpi_SDI_Direction at TRISC4_bit;
sbit SoftSpi_SDO_Direction at TRISC5_bit;

unsigned int value;

void InitMain() {
    TRISB0_bit = 1;       // Set RA0 pin as input
    TRISB1_bit = 1;      // Set RA1 pin as input
    Chip_Select = 1;     // Deselect DAC
    Chip_Select_Direction = 0; // Set CS# pin as Output
    Soft_SPI_Init();    // Initialize Soft_SPI
}

// DAC increments (0..4095) --> output voltage (0..Vref)
void DAC_Output(unsigned int valueDAC) {
    char temp;

    Chip_Select = 0;     // Select DAC chip

    // Send High Byte
    temp = (valueDAC >> 8) & 0x0F; // Store valueDAC[11..8] to temp[3..0]
    temp |= 0x30;       // Define DAC setting, see MCP4921 datasheet
    Soft_SPI_Write(temp); // Send high byte via Soft_SPI

    // Send Low Byte
    temp = valueDAC;      // Store valueDAC[7..0] to temp[7..0]
    Soft_SPI_Write(temp); // Send low byte via Soft_SPI

    Chip_Select = 1;      // Deselect DAC chip
}

void main() {
    ANSEL = 0;          // turn off analog inputs
}
```
ANSELH = 0;

InitMain(); // Perform main initialization

value = 2048; // When program starts, DAC gives // the output in the mid-range

while (1) { // Endless loop

    if ((RA0_bit) && (value < 4095)) { // If RA0 button is pressed
        value++; // increment value
    }
    else {
        if ((RA1_bit) && (value > 0)) { // If RA1 button is pressed
            value--; // decrement value
        }
    }

    DAC_Output(value); // Send value to DAC chip
    Delay_ms(1); // Slow down key repeat pace
}

SOFTWARE UART LIBRARY

The *mikroC PRO for PIC* provides routines for implementing Software UART communication. These routines are hardware independent and can be used with any MCU. The Software UART Library provides easy communication with other devices via the RS232 protocol.

**Note**: The Software UART library implements time-based activities, so interrupts need to be disabled when using it.

**Library Routines**

- Soft_Uart_Init
- Soft_Uart_Read
- Soft_Uart_Write
- Soft_Uart_Break
## Soft_UART_Init

### Prototype

```c
char Soft_UART_Init(char *port, char rx_pin, char tx_pin,
unsigned long baud_rate, char inverted);
```

### Returns

- **2** - error, requested baud rate is too low
- **1** - error, requested baud rate is too high
- **0** - successful initialization

### Description

Configures and initializes the software UART module.

**Parameters:**

- **port**: port to be used.
- **rx_pin**: sets rx_pin to be used.
- **tx_pin**: sets tx_pin to be used.
- **baud_rate**: baud rate to be set. Maximum baud rate depends on the MCU’s clock and working conditions.
- **inverted**: inverted output flag. When set to a non-zero value, inverted logic on output is used.

Software UART routines use Delay_Cyc routine. If requested baud rate is too low then calculated parameter for calling `Delay_Cyc` exceeds `Delay_Cyc` argument range.

If requested baud rate is too high then rounding error of `Delay_Cyc` argument corrupts Software UART timings.

### Requires

Nothing.

### Example

This will initialize software UART and establish the communication at 9600 bps:

```c
char error;
...
error = Soft_UART_Init(&PORTC, 7, 6, 14400, 0); // Initialize Soft UART at 9600 bps
```
### Soft_UART_Read

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>char Soft_UART_Read(char * error);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Byte received via UART.</td>
</tr>
</tbody>
</table>
| Description        | The function receives a byte via software UART.  
This is a blocking function call (waits for start bit). Programmer can unblock it by calling Soft_UART_Break routine.  
Parameters:  
- `error`: Error flag. Error code is returned through this variable.  
  0 - no error  
  1 - stop bit error  
  255 - user abort, Soft_UART_Break called |
| Requires           | Software UART must be initialized before using this function. See the Soft_UART_Init routine. |
| Example            |  
```c  
char data, error;  
...  
// wait until data is received  
do  
  data = Soft_UART_Read(&error);  
while (error);  

// Now we can work with data:  
if (data) {...}  
```
### Soft_UART_Write

**Prototype**

```c
void Soft_UART_Write(char udata);
```

**Returns**

Nothing.

**Description**

This routine sends one byte via the Software UART bus.

**Parameters:**
- `udata`: data to be sent.

**Requires**

Software UART must be initialized before using this function. See the Soft_UART_Init routine.

Be aware that during transmission, software UART is incapable of receiving data – data transfer protocol must be set in such a way to prevent loss of information.

**Example**

```c
char some_byte = 0x0A;
...
// Write a byte via Soft Uart
Soft_UART_Write(some_byte);
```

### Soft_Uart_Break

**Prototype**

```c
void Soft_UART_Break();
```

**Returns**

Nothing.

**Description**

Soft_UART_Read is blocking routine and it can block the program flow. Calling this routine from the interrupt will unblock the program execution. This mechanism is similar to WDT.

**Note:** Interrupts should be disabled before using Software UART routines again (see note at the top of this page).

**Requires**

Nothing.

**Example**

```c
char data1, error, counter = 0;
void interrupt() {
    if (INTCON.T0IF) {
        if (counter >= 20) {
            Soft_UART_Break();
            counter = 0;             // reset counter
        } else
            counter++;              // increment counter
        INTCON.T0IF = 0;          // Clear Timer0 overflow interrupt flag
    }
}
```
Example

```c
void main() {

    OPTION_REG = 0x04; // TMR0 prescaler set to 1:32
    ...

    if (Soft_UART_Init(&PORTC, 7, 6, 9600, 0) = 0)
        Soft_UART_Write(0x55);
    ...

    // try Soft_UART_Read with blocking prevention mechanism
    INTCON.GIE = 1; // Global interrupt enable
    INTCON.TOIE = 1; // Enable Timer0 overflow interrupt
    data1 = Soft_UART_Read(&error);
    INTCON.GIE = 0; // Global interrupt disable
}
```
Library Example

This example demonstrates simple data exchange via software UART. If MCU is connected to the PC, you can test the example from the *mikroC PRO for PIC* USART Terminal Tool.

```c
char i, error, byte_read;       // Auxiliary variables
void main(){
    ANSEL  = 0;                // Configure AN pins as digital I/O
    ANSELH = 0;
    TRISB = 0x00;              // Set PORTB as output (error signalization)
    PORTB = 0;                 // No error
    error = Soft_UART_Init(&PORTC, 7, 6, 14400, 0); // Initialize Soft UART at 9600 bps
    if (error > 0) {
        PORTB = error;       // Signalize Init error
        while(1);            // Stop program
    }
    Delay_ms(100);

    for (i = 'z'; i >= 'A'; i--) {// Send bytes from 'z' downto 'A'
        Soft_UART_Write(i);
        Delay_ms(100);
    }

    while(1) {                    // Endless loop
        byte_read = Soft_UART_Read(&error);    // Read byte, then test error flag
        if (error)                         // If error was detected
            PORTB = error;                 // signal it on PORTB
        else
            Soft_UART_Write(byte_read);    // If error was not detected, return byte read
    }
}
```
SOUND LIBRARY

The *mikroC PRO for PIC* provides a Sound Library to supply users with routines necessary for sound signalization in their applications. Sound generation needs additional hardware, such as piezo-speaker (example of piezo-speaker interface is given on the schematic at the bottom of this page).

**Library Routines**

- Sound_Init
- Sound_Play

### Sound_Init

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void Sound_Init(char *snd_port, char snd_pin);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Configures the appropriate MCU pin for sound generation.</td>
</tr>
<tr>
<td>Parameters:</td>
<td>- <em>snd_port</em>: sound output port address</td>
</tr>
<tr>
<td></td>
<td>- <em>snd_pin</em>: sound output pin</td>
</tr>
<tr>
<td>Requires</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Example</td>
<td>// Initialize the pin RD3 for playing sound</td>
</tr>
<tr>
<td></td>
<td>Sound_Init(&amp;PORTD, 3);</td>
</tr>
</tbody>
</table>

**Sound_Play**

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void Sound_Play(unsigned freq_in_hz, unsigned duration_ms);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Generates the square wave signal on the appropriate pin.</td>
</tr>
<tr>
<td></td>
<td>Parameters:</td>
</tr>
<tr>
<td></td>
<td>- freq_in_Hz: signal frequency in Hertz (Hz)</td>
</tr>
<tr>
<td></td>
<td>- duration_ms: signal duration in miliseconds (ms)</td>
</tr>
<tr>
<td>Note:</td>
<td>frequency range is limited by Delay_Cyc parameter. Maximum frequency that can be produced by this function is $F_{max} = \frac{F_{osc}}{(80<em>3)}$. Minimum frequency is $F_{min} = \frac{F_{osc}}{(80</em>255)}$. Generated frequency may differ from the freq_in_hz parameter due to integer arithmetics.</td>
</tr>
<tr>
<td>Requires</td>
<td>In order to hear the sound, you need a piezo speaker (or other hardware) on designated port. Also, you must call Sound_Init to prepare hardware for output before using this function.</td>
</tr>
<tr>
<td>Example</td>
<td>// Play sound of 1KHz in duration of 100ms Sound_Play(1000, 100);</td>
</tr>
</tbody>
</table>

**Library Example**

The example is a simple demonstration of how to use the Sound Library for playing tones on a piezo speaker.

```c
void Tone1() {
    Sound_Play(659, 250);   // Frequency = 659Hz, duration = 250ms
}

void Tone2() {
    Sound_Play(698, 250);   // Frequency = 698Hz, duration = 250ms
}

void Tone3() {
    Sound_Play(784, 250);   // Frequency = 784Hz, duration = 250ms
}

void Melody() {           // Plays the melody "Yellow house"
    Tone1(); Tone2(); Tone3(); Tone3();
    Tone1(); Tone2(); Tone3(); Tone3();
    Tone1(); Tone2(); Tone3();
    Tone1(); Tone2(); Tone3();
    Tone3(); Tone3(); Tone2();
    Tone1();
}
```
void ToneA() {
    Sound_Play(880, 50);
}

void ToneC() {
    Sound_Play(1046, 50);
}

void ToneE() {
    Sound_Play(1318, 50);
}

void Melody2() {
    unsigned short i;
    for (i = 9; i > 0; i--) {
        ToneA(); ToneC(); ToneE();
    }
}

void main() {
    ANSEL = 0;               // Configure AN pins as digital I/O
    ANSELH = 0;
    TRISB = 0xF8;            // Configure RB7..RB3 as input
    TRISD = 0xF7;            // Configure RD3 as output

    Sound_Init(&PORTD, 3);
    Sound_Play(1000, 1000);

    while (1) {
        if (Button(&PORTB,7,1,1))   // RB7 plays Tone1
            Tone1();
        while (PORTB & 0x80);      // Wait for button to be released

        if (Button(&PORTB,6,1,1))   // RB6 plays Tone2
            Tone2();
        while (PORTB & 0x40);      // Wait for button to be released

        if (Button(&PORTB,5,1,1))   // RB5 plays Tone3
            Tone3();
        while (PORTB & 0x20);      // Wait for button to be released

        if (Button(&PORTB,4,1,1))   // RB4 plays Melody2
            Melody2();
        while (PORTB & 0x10);      // Wait for button to be released

        if (Button(&PORTB,3,1,1))   // RB3 plays Melody
            Melody();
        while (PORTB & 0x08);      // Wait for button to be released
    }
}
HW Connection

PIEZO SPEAKER

Example of Sound Library sonnection
**SPI LIBRARY**

SPI module is available with a number of PIC MCU models. *mikroC PRO for PIC* provides a library for initializing Slave mode and comfortable work with Master mode. PIC can easily communicate with other devices via SPI: A/D converters, D/A converters, MAX7219, LTC1290, etc. You need PIC MCU with hardware integrated SPI (for example, PIC16F877).

**Note:** Some PIC18 MCUs have multiple SPI modules. Switching between the SPI modules in the SPI library is done by the SPI_Set_Active function (SPI module has to be previously initialized).

**Note:** In order to use the desired SPI library routine, simply change the number 1 in the prototype with the appropriate module number, i.e. SPI2_Init();

**Library Routines**

- Spi1_Init
- Spi1_Init_Advanced
- Spi1_Read
- Spi1_Write
- Spi_Set_Active

**Spi_Init**

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void SPI1_Init(void);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>This routine configures and enables SPI module with the following settings:</td>
</tr>
<tr>
<td></td>
<td>- master mode</td>
</tr>
<tr>
<td></td>
<td>- 8 bit data transfer</td>
</tr>
<tr>
<td></td>
<td>- most significant bit sent first</td>
</tr>
<tr>
<td></td>
<td>- serial clock low when idle</td>
</tr>
<tr>
<td></td>
<td>- data sampled on leading edge</td>
</tr>
<tr>
<td></td>
<td>- serial clock = fosc/4</td>
</tr>
<tr>
<td>Requires</td>
<td>You need PIC MCU with hardware integrated SPI.</td>
</tr>
<tr>
<td>Example</td>
<td>SPI1_Init();  // Initialize the SPI module with default settings</td>
</tr>
</tbody>
</table>
### Spi1_Init_Advanced

**Prototype**

```c
void SPI1_Init_Advanced(unsigned short master_slav, unsigned short data_sample, unsigned short clock_idle, unsigned short transmit_edge);
```

**Returns**

Nothing.

**Description**

Configures and initializes SPI. SPI1_Init or SPI1_Init_Advanced needs to be called before using other functions of SPI Library.

Parameters `mode`, `data_sample` and `clock_idle` configure the SPI module, and can have the following values:

<table>
<thead>
<tr>
<th>Description</th>
<th>Predefined library const</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>SPI work mode:</strong></td>
<td></td>
</tr>
<tr>
<td>Master clock = Fosc/4</td>
<td>_SPI_MASTER_OSC_DIV4</td>
</tr>
<tr>
<td>Master clock = Fosc/16</td>
<td>_SPI_MASTER_OSC_DIV16</td>
</tr>
<tr>
<td>Master clock = Fosc/64</td>
<td>_SPI_MASTER_OSC_DIV64</td>
</tr>
<tr>
<td>Master clock source TMR2</td>
<td>_SPI_MASTER_TMR2</td>
</tr>
<tr>
<td>Slave select enabled</td>
<td>_SPI_SLAVE_SS_ENABLE</td>
</tr>
<tr>
<td>Slave select disabled</td>
<td>_SPI_SLAVE_SS_DIS</td>
</tr>
<tr>
<td><strong>Data sampling interval:</strong></td>
<td></td>
</tr>
<tr>
<td>Input data sampled in middle of interval</td>
<td>_SPI_DATA_SAMPLE_MIDDLE</td>
</tr>
<tr>
<td>Input data sampled at the end of interval</td>
<td>_SPI_DATA_SAMPLE_END</td>
</tr>
<tr>
<td><strong>SPI clock idle state:</strong></td>
<td></td>
</tr>
<tr>
<td>Clock idle HIGH</td>
<td>_SPI_CLK_IDLE_HIGH</td>
</tr>
<tr>
<td>Clock idle LOW</td>
<td>_SPI_CLK_IDLE_LOW</td>
</tr>
<tr>
<td><strong>Transmit edge:</strong></td>
<td></td>
</tr>
<tr>
<td>Data transmit on low to high edge</td>
<td>_SPI_LOW_2_HIGH</td>
</tr>
<tr>
<td>Data transmit on high to low edge</td>
<td>_SPI_HIGH_2_LOW</td>
</tr>
</tbody>
</table>

**Requires**

You need PIC MCU with hardware integrated SPI.

**Example**

```c
// Set SPI1 module to master mode, clock = Fosc/4, data sampled at the middle of interval, clock idle state low and data transmitted at low to high edge:
SPI1_Init_Advanced(_SPI_MASTER_OSC_DIV4, _SPI_DATA_SAMPLE_MIDDLE, _SPI_CLK_IDLE_LOW, _SPI_LOW_2_HIGH);
```
## Spi1_Read

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned short SPI1_Read(unsigned short buffer);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Returns the received data.</td>
</tr>
<tr>
<td>Description</td>
<td>Reads one byte from the SPI bus.</td>
</tr>
<tr>
<td>Parameters:</td>
<td>- <code>buffer</code>: dummy data for clock generation (see device Datasheet for SPI modules implementation details)</td>
</tr>
<tr>
<td>Requires</td>
<td>You need PIC MCU with hardware integrated SPI.</td>
</tr>
<tr>
<td>SPI must be initialized and communication established before using this function. See SPI1_Init_Advanced or SPI1_Init.</td>
<td></td>
</tr>
</tbody>
</table>
| Example         | ```short take, buffer;...
take = SPI1_Read(buffer);``` |

## Spi1_Write

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void SPI1_Write(unsigned short data__);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Writes byte via the SPI bus.</td>
</tr>
<tr>
<td>Parameters:</td>
<td>- <code>wrdata</code>: data to be sent</td>
</tr>
<tr>
<td>Requires</td>
<td>You need PIC MCU with hardware integrated SPI.</td>
</tr>
<tr>
<td>SPI must be initialized and communication established before using this function. See SPI1_Init_Advanced or SPI1_Init.</td>
<td></td>
</tr>
<tr>
<td>Example</td>
<td><code>SPI1_Write(1);</code></td>
</tr>
</tbody>
</table>
SPI_Set_Active

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void SPI_Set_Active(char (*read_ptr)(char))</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Sets the active SPI module which will be used by the SPI routines. Parameters:</td>
</tr>
<tr>
<td></td>
<td>- read_ptr: SPI1_Read handler</td>
</tr>
<tr>
<td>Requires</td>
<td>Routine is available only for MCUs with two SPI modules. Used SPI module must be initialized before using this function. See the SPI1_Init, SPI1_Init_Advanced</td>
</tr>
<tr>
<td>Example</td>
<td>SPI_Set_Active(&amp;SPI2_Read); // Sets the SPI2 module active</td>
</tr>
</tbody>
</table>

Library Example

The code demonstrates how to use SPI library functions for communication between SPI module of the MCU and Microchip's MCP4921 12-bit D/A converter

```c
// DAC module connections
sbit Chip_Select at RC0_bit;
sbit Chip_Select_Direction at TRISC0_bit;
// End DAC module connections

unsigned int value;

void InitMain() {
    TRISB0_bit = 1;                        // Set RA0 pin as input
    TRISB1_bit = 1;                        // Set RA1 pin as input
    Chip_Select = 1;                       // Deselect DAC
    Chip_Select_Direction = 0;             // Set CS# pin as Output
    SPI1_Init();                           // Initialize SPI module
}

// DAC increments (0..4095) --> output voltage (0..Vref)
void DAC_Output(unsigned int valueDAC) {
    char temp;

    Chip_Select = 0;                       // Select DAC chip

    // Send High Byte
    temp = (valueDAC >> 8) & 0x0F;         // Store valueDAC[11..8] to temp[3..0]
    temp |= 0x30;                          // Define DAC setting, see MCP4921 datasheet
    SPI1_Write(temp);                     // Send high byte via SPI
    // Send Low Byte

    // Send Low Byte
}
```
temp = valueDAC; // Store valueDAC[7..0] to temp[7..0]
SPI1_Write(temp); // Send low byte via SPI

Chip_Select = 1; // Deselect DAC chip

void main() {
    ANSEL = 0;
    ANSELH = 0;
    InitMain(); // Perform main initialization

    value = 2048; // When program starts, DAC gives
                   // the output in the mid-range

    while (1) { // Endless loop
        if ((RA0_bit) && (value < 4095)) { // If RA0 button is pressed
            value++; // increment value
        }
        else {
            if ((RA1_bit) && (value > 0)) { // If RA1 button is pressed
                value--; // decrement value
            }
        }
        DAC_Output(value); // Send value to DAC chip
        Delay_ms(1); // Slow down key repeat pace
    }
}

SPI ETHERNET LIBRARY

The ENC28J60 is a stand-alone Ethernet controller with an industry standard Serial Peripheral Interface (SPI™). It is designed to serve as an Ethernet network interface for any controller equipped with SPI.

The ENC28J60 meets all of the IEEE 802.3 specifications. It incorporates a number of packet filtering schemes to limit incoming packets. It also provides an internal DMA module for fast data throughput and hardware assisted IP checksum calculations. Communication with the host controller is implemented via two interrupt pins and the SPI, with data rates of up to 10 Mb/s. Two dedicated pins are used for LED link and network activity indication.

This library is designed to simplify handling of the underlying hardware (ENC28J60). It works with any PIC with integrated SPI and more than 4 Kb ROM memory. 38 to 40 MHz clock is recommended to get from 8 to 10 Mhz SPI clock, otherwise PIC should be clocked by ENC28J60 clock output due to its silicon bug in SPI hardware. If you try lower PIC clock speed, there might be board hang or miss some requests.

SPI Ethernet library supports:

- IPv4 protocol.
- ARP requests.
- ICMP echo requests.
- UDP requests.
- TCP requests (no stack, no packet reconstruction).
- ARP client with cache.
- DNS client.
- UDP client.
- DHCP client.
- packet fragmentation is NOT supported.

Note: Due to PIC16 RAM/Flash limitations PIC16 library does NOT have ARP, DNS, UDP and DHCP client support implemented.

Note: Global library variable SPI_Ethernet_userTimerSec is used to keep track of time for all client implementations (ARP, DNS, UDP and DHCP). It is user responsibility to increment this variable each second in it's code if any of the clients is used.

Note: For advanced users there are header files ("eth_enc28j60LibDef.h" and "eth_enc28j60LibPrivate.h") in Uses\P16 and Uses\P18 folders of the compiler with description of all routines and global variables, relevant to the user, implemented in the SPI Ethernet Library.
Note: The appropriate hardware SPI module must be initialized before using any of the SPI Ethernet library routines. Refer to SPI Library.

For MCUs with two SPI modules it is possible to initialize both of them and then switch by using the SPI_Set_Active() routine.

**External dependencies of SPI Ethernet Library**

<table>

<tr>
<td></td>
<td>- maximum packet size is set to 1518.</td>
</tr>
<tr>
<td></td>
<td>- Back-to-Back Inter-Packet Gap: 0x15 in full duplex mode; 0x12 in half duplex mode.</td>
</tr>
<tr>
<td></td>
<td>- Non-Back-to-Back Inter-Packet Gap: 0x0012 in full duplex mode; 0x0C12 in half duplex mode.</td>
</tr>
<tr>
<td></td>
<td>- Collision window is set to 63 in half duplex mode to accommodate some ENC28J60 revisions silicon bugs.</td>
</tr>
<tr>
<td></td>
<td>- CLKOUT output is disabled to reduce EMI generation.</td>
</tr>
<tr>
<td></td>
<td>- half duplex loopback disabled.</td>
</tr>
<tr>
<td></td>
<td>- LED configuration: default (LEDA-link status, LEDB-link activity).</td>
</tr>
</tbody>
</table>

Parameters:

- **mac**: RAM buffer containing valid MAC address.
- **ip**: RAM buffer containing valid IP address.
- **fullDuplex**: ethernet duplex mode switch. Valid values: 0 (half duplex mode) and 1 (full duplex mode).
### Global variables:
- `SPI_Ethernet_CS`: Chip Select line
- `SPI_Ethernet_CS_Direction`: Direction of the Chip Select pin
- `SPI_Ethernet_RST`: Reset line
- `SPI_Ethernet_RST_Direction`: Direction of the Reset pin

**Requires**

must be defined before using this function.

The SPI module needs to be initialized. See the `SPI1_Init` and `SPI1_Init_Advanced` routines.

### Example

```c
#define SPI_Ethernet_HALFDUPLEX     0
#define SPI_Ethernet_FULLDUPLEX     1

// Ethernet NIC pinout
sfr sbit SPI_Ethernet_Rst at RC0_bit;
sfr sbit SPI_Ethernet_CS at RC1_bit;
sfr sbit SPI_Ethernet_Rst_Direction at TRISC0_bit;
sfr sbit SPI_Ethernet_CS_Direction at TRISC1_bit;
// end ethernet NIC definitions

unsigned char myMacAddr[6] = {0x00, 0x14, 0xA5, 0x76, 0x19, 0x3f}; // my MAC address
unsigned char myIpAddr  = {192, 168, 1, 60}; // my IP addr

SPI1_Init();
SPI_Ethernet_Init(myMacAddr, myIpAddr, SPI_Ethernet_FULLDUPLEX);```
Spi_Ethernet_Enable

Prototype

\[
\text{void SPI\_Ethernet\_Enable(}\text{unsigned char enFlt)\};}
\]

Returns

This is MAC module routine. This routine enables appropriate network traffic on the ENC28J60 module by the means of it's receive filters (unicast, multicast, broadcast, crc). Specific type of network traffic will be enabled if a corresponding bit of this routine's input parameter is set. Therefore, more than one type of network traffic can be enabled at the same time. For this purpose, predefined library constants (see the table below) can be OR'ed to form appropriate input value.

Parameters:
- \text{enFlt}: network traffic/receive filter flags. Each bit corresponds to the appropriate network traffic/receive filter:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Mask</th>
<th>Description</th>
<th>Predefined library const</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0x01</td>
<td>MAC Broadcast traffic/receive filter flag. When set, MAC broadcast traffic will be enabled.</td>
<td>_SPI_Ethernet_BROADCAST</td>
</tr>
<tr>
<td>1</td>
<td>0x02</td>
<td>MAC Multicast traffic/receive filter flag. When set, MAC multicast traffic will be enabled.</td>
<td>_SPI_Ethernet_MULTICAST</td>
</tr>
<tr>
<td>2</td>
<td>0x04</td>
<td>not used</td>
<td>none</td>
</tr>
<tr>
<td>3</td>
<td>0x08</td>
<td>not used</td>
<td>none</td>
</tr>
<tr>
<td>4</td>
<td>0x10</td>
<td>not used</td>
<td>none</td>
</tr>
<tr>
<td>5</td>
<td>0x20</td>
<td>CRC check flag. When set, packets with invalid CRC field will be discarded.</td>
<td>_SPI_Ethernet_CRC</td>
</tr>
<tr>
<td>6</td>
<td>0x40</td>
<td>not used</td>
<td>none</td>
</tr>
<tr>
<td>7</td>
<td>0x80</td>
<td>MAC Unicast traffic/receive filter flag. When set, MAC unicast traffic will be enabled.</td>
<td>_SPI_Ethernet_UNICAST</td>
</tr>
</tbody>
</table>

Note: Advance filtering available in the ENC28J60 module such as Pattern Match, Magic Packet and Hash Table can not be enabled by this routine. Additionally, all filters, except CRC, enabled with this routine will work in OR mode, which means that packet will be received if any of the enabled filters accepts it.

Note: This routine will change receive filter configuration on-the-fly. It will not, in any way, mess with enabling/disabling receive/transmit logic or any other part of the ENC28J60 module. The ENC28J60 module should be properly configured by the means of SPI\_Ethernet\_Init routine.
**Spi_Ethernet_Disable**

**Requires**
Ethernet module has to be initialized. See SPI_Ethernet_Init.

**Example**
SPI_Ethernet_Enable(_SPI_Ethernet_CRC | _SPI_Ethernet_UNICAST);

// enable CRC checking and Unicast traffic

**Prototype**

```c
void SPI_Ethernet_Disable(unsigned char disFlt);
```

**Returns**
Nothing.

This is MAC module routine. This routine disables appropriate network traffic on the ENC28J60 module by the means of it's receive filters (unicast, multicast, broadcast, crc). Specific type of network traffic will be disabled if a corresponding bit of this routine's input parameter is set. Therefore, more than one type of network traffic can be disabled at the same time. For this purpose, predefined library constants (see the table below) can be ORed to form appropriate input value.

**Parameters:**
- `disFlt`: network traffic/receive filter flags. Each bit corresponds to the appropriate network traffic/receive filter:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Mask</th>
<th>Description</th>
<th>Predefined library const</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0x01</td>
<td>MAC Broadcast traffic/receive filter flag. When set, MAC broadcast traffic will be disabled.</td>
<td>Spi_Ethernet_BROADCAST</td>
</tr>
<tr>
<td>1</td>
<td>0x02</td>
<td>MAC Multicast traffic/receive filter flag. When set, MAC multicast traffic will be disabled.</td>
<td>Spi_Ethernet_MULTICAST</td>
</tr>
<tr>
<td>2</td>
<td>0x04</td>
<td>not used</td>
<td>none</td>
</tr>
<tr>
<td>3</td>
<td>0x08</td>
<td>not used</td>
<td>none</td>
</tr>
<tr>
<td>4</td>
<td>0x10</td>
<td>not used</td>
<td>none</td>
</tr>
<tr>
<td>5</td>
<td>0x20</td>
<td>CRC check flag. When set, CRC check will be disabled and packets with invalid CRC field will be accepted.</td>
<td>Spi_Ethernet_CRC</td>
</tr>
<tr>
<td>6</td>
<td>0x40</td>
<td>not used</td>
<td>none</td>
</tr>
<tr>
<td>7</td>
<td>0x80</td>
<td>MAC Unicast traffic/receive filter flag. When set, MAC unicast traffic will be disabled.</td>
<td>Spi_Ethernet_UNICAST</td>
</tr>
</tbody>
</table>

**Note:** Advance filtering available in the ENC28J60 module such as Pattern Match, Magic Packet and Hash Table can not be disabled by this routine.

**Note:** This routine will change receive filter configuration on-the-fly. It will not, in any way, mess with enabling/disabling receive/transmit logic or any other part of the ENC28J60 module. The ENC28J60 module should be properly configurred by the means of SPI_Ethernet_Init routine.
### SPI_Ethernet_doPacket

**Prototype**

```c
unsigned char SPI_Ethernet_doPacket();
```

<table>
<thead>
<tr>
<th>Requires</th>
<th>Ethernet module has to be initialized. See SPI_Ethernet_Init.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example</td>
<td>SPI_Ethernet_Disable(_SPI_Ethernet_CRC</td>
</tr>
</tbody>
</table>

**Returns**

- 0 - upon successful packet processing (zero packets received or received packet processed successfully).
- 1 - upon reception error or receive buffer corruption. ENC28J60 controller needs to be restarted.
- 2 - received packet was not sent to us (not our IP, nor IP broadcast address).
- 3 - received IP packet was not IPv4.
- 4 - received packet was of type unknown to the library.

**Description**

This is MAC module routine. It processes next received packet if such exists. Packets are processed in the following manner:

- ARP & ICMP requests are replied automatically.
- upon TCP request the Spi_Ethernet_UserTCP function is called for further processing.
- upon UDP request the Spi_Ethernet_UserUDP function is called for further processing.

**Note:** Spi_Ethernet_doPacket must be called as often as possible in user's code.

**Requires**

Ethernet module has to be initialized. See Spi_Ethernet_Init.

**Example**

```c
if (SPI_Ethernet_doPacket() == 0) {  // process received packets
  ...
}
```
### Spi_Ethernet_putByte

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void SPI_Ethernet_putByte(unsigned char v);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Returns</strong></td>
<td>Nothing.</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>This is MAC module routine. It stores one byte to address pointed by the current ENC28J60 write pointer (EWRPT). Parameters: - <code>v</code>: value to store</td>
</tr>
<tr>
<td><strong>Requires</strong></td>
<td>Ethernet module has to be initialized. See Spi_Ethernet_Init.</td>
</tr>
</tbody>
</table>
| **Example**                   | `char data;`  
|                               | ...  
|                               | SPI_Ethernet_putByte(data); // put an byte into ENC28J60 buffer |

### Spi_Ethernet_putBytes

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void SPI_Ethernet_putBytes(unsigned char *ptr, unsigned char n);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Returns</strong></td>
<td>Nothing.</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>This is MAC module routine. It stores requested number of bytes into ENC28J60 RAM starting from current ENC28J60 write pointer (EWRPT) location. Parameters: - <code>ptr</code>: RAM buffer containing bytes to be written into ENC28J60 RAM. - <code>n</code>: number of bytes to be written.</td>
</tr>
<tr>
<td><strong>Requires</strong></td>
<td>Ethernet module has to be initialized. See Spi_Ethernet_Init.</td>
</tr>
</tbody>
</table>
| **Example**                   | `char *buffer = "mikroElektronika";`  
|                               | ...  
|                               | SPI_Ethernet_putBytes(buffer, 16); // put an RAM array into ENC28J60 buffer |
### Spi_Ethernet_putConstBytes

**Prototype**

```c
void SPI_Ethernet_putConstBytes(const unsigned char *ptr, unsigned char n);
```

**Returns**

Nothing.

**Description**

This is MAC module routine. It stores requested number of const bytes into ENC28J60 RAM starting from current ENC28J60 write pointer (EWRPT) location.

**Parameters:**

- `ptr`: const buffer containing bytes to be written into ENC28J60 RAM.
- `n`: number of bytes to be written.

**Requires**

Ethernet module has to be initialized. See Spi_Ethernet_Init.

**Example**

```c
const char *buffer = "mikroElektronika";
...
SPI_Ethernet_putConstBytes(buffer, 16); // put a const array into ENC28J60 buffer
```

### Spi_Ethernet_putString

**Prototype**

```c
unsigned int SPI_Ethernet_putString(unsigned char *ptr);
```

**Returns**

Number of bytes written into ENC28J60 RAM.

**Description**

This is MAC module routine. It stores whole string (excluding null termination) into ENC28J60 RAM starting from current ENC28J60 write pointer (EWRPT) location.

**Parameters:**

- `ptr`: string to be written into ENC28J60 RAM.

**Requires**

Ethernet module has to be initialized. See Spi_Ethernet_Init.

**Example**

```c
char *buffer = "mikroElektronika";
...
SPI_Ethernet_putString(buffer); // put a RAM string into ENC28J60 buffer
```
## Spi_Ethernet_putConstString

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned int SPI_Ethernet_putConstString(const unsigned char *ptr);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Returns</strong></td>
<td>Number of bytes written into ENC28J60 RAM.</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>This is MAC module routine. It stores whole const string (excluding null termination) into ENC28J60 RAM starting from current ENC28J60 write pointer (EWRPT) location.</td>
</tr>
<tr>
<td>Parameters:</td>
<td>- <code>ptr</code>: const string to be written into ENC28J60 RAM.</td>
</tr>
<tr>
<td><strong>Requires</strong></td>
<td>Ethernet module has to be initialized. See Spi_Ethernet_Init.</td>
</tr>
<tr>
<td><strong>Example</strong></td>
<td><code>const char *buffer = &quot;mikroElektronika&quot;;</code></td>
</tr>
<tr>
<td></td>
<td>...</td>
</tr>
<tr>
<td></td>
<td>SPI_Ethernet_putConstString(buffer); // put a const string into ENC28J60 buffer</td>
</tr>
</tbody>
</table>

## Spi_Ethernet_getByte

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned char SPI_Ethernet_getByte();</code></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Returns</strong></td>
<td>Byte read from ENC28J60 RAM.</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>This is MAC module routine. It fetches a byte from address pointed to by current ENC28J60 read pointer (ERDPT).</td>
</tr>
<tr>
<td><strong>Requires</strong></td>
<td>Ethernet module has to be initialized. See Spi_Ethernet_Init.</td>
</tr>
<tr>
<td><strong>Example</strong></td>
<td><code>char buffer;</code></td>
</tr>
<tr>
<td></td>
<td>...</td>
</tr>
<tr>
<td></td>
<td>buffer = SPI_Ethernet_getByte(); // read a byte from ENC28J60 buffer</td>
</tr>
</tbody>
</table>
### Spi_Ethernet_getBytes

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void SPI_Ethernet_getBytes(unsigned char *ptr, unsigned int addr, unsigned char n);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
</tbody>
</table>
| Description | This is MAC module routine. It fetches equested number of bytes from ENC28J60 RAM starting from given address. If value of 0xFFFF is passed as the address parameter, the reading will start from current ENC28J60 read pointer (ERDPT) location. Parameters:  
  - *ptr*: buffer for storing bytes read from ENC28J60 RAM.  
  - *addr*: ENC28J60 RAM start address. Valid values: 0..8192.  
  - *n*: number of bytes to be read. |
| Requires  | Ethernet module has to be initialized. See Spi_Ethernet_Init.                     |
| Example   | char buffer[16];  
  ...  
  SPI_Ethernet_getBytes(buffer, 0x100, 16); // read 16 bytes, starting from address 0x100 |
### Spi_Ethernet_UserTCP

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned int SPI_Ethernet_UserTCP(unsigned char *remoteHost, unsigned int remotePort, unsigned int localPort, unsigned int reqLength);</code></th>
</tr>
</thead>
</table>
| Returns   | - 0 - there should not be a reply to the request.  
- Length of TCP/HTTP reply data field - otherwise. |
| Description | This is TCP module routine. It is internally called by the library. The user accesses to the TCP/HTTP request by using some of the SPI_Ethernet_get routines. The user puts data in the transmit buffer by using some of the SPI_Ethernet_put routines. The function must return the length in bytes of the TCP/HTTP reply, or 0 if there is nothing to transmit. If there is no need to reply to the TCP/HTTP requests, just define this function with return(0) as a single statement.  
Parameters:  
- `remoteHost`: client's IP address.  
- `remotePort`: client's TCP port.  
- `localPort`: port to which the request is sent.  
- `reqLength`: TCP/HTTP request data field length.  
**Note:** The function source code is provided with appropriate example projects. The code should be adjusted by the user to achieve desired reply.  
| Requires | Ethernet module has to be initialized. See Spi_Ethernet_Init. |
| Example | This function is internally called by the library and should not be called by the user's code. |
### Spi_Ethernet_UserUDP

**Prototype**

```c
unsigned int SPI_Ethernet_UserUDP(unsigned char *remoteHost, unsigned int remotePort, unsigned int destPort, unsigned int reqLength);
```

**Returns**

- 0 - there should not be a reply to the request.
- Length of UDP reply data field - otherwise.

**Description**

This is UDP module routine. It is internally called by the library. The user accesses to the UDP request by using some of the SPI_Ethernet_get routines. The user puts data in the transmit buffer by using some of the SPI_Ethernet_put routines. The function must return the length in bytes of the UDP reply, or 0 if nothing to transmit. If you don't need to reply to the UDP requests, just define this function with a return(0) as single statement.

**Parameters:**

- `remoteHost`: client's IP address.
- `remotePort`: client's port.
- `destPort`: port to which the request is sent.
- `reqLength`: UDP request data field length.

**Note:** The function source code is provided with appropriate example projects. The code should be adjusted by the user to achieve desired reply.

**Requires**

Ethernet module has to be initialized. See Spi_Ethernet_Init.

**Example**

This function is internally called by the library and should not be called by the user's code.

### SPI_Ethernet_getIpAddress

**Prototype**

```c
unsigned char * SPI_Ethernet_getIpAddress();
```

**Returns**

Pointer to the global variable holding IP address.

**Description**

This routine should be used when DHCP server is present on the network to fetch assigned IP address.

**Note:** User should always copy the IP address from the RAM location returned by this routine into it's own IP address buffer. These locations should not be altered by the user in any case.

**Requires**

Ethernet module has to be initialized. See SPI_Ethernet_Init.
Available for PIC18 family MCUs only.

**Example**

```c
unsigned char ipAddr[4]; // user IP address buffer
...
memcpy(ipAddr, SPI_Ethernet_getIpAddress(), 4); // fetch IP address
```
### SPI_Ethernet_getGwIpAddress

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned char * SPI_Ethernet_getGwIpAddress();</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Pointer to the global variable holding gateway IP address.</td>
</tr>
<tr>
<td>Description</td>
<td>This routine should be used when DHCP server is present on the network to fetch assigned gateway IP address. <strong>Note:</strong> User should always copy the IP address from the RAM location returned by this routine into its own gateway IP address buffer. These locations should not be altered by the user in any case!</td>
</tr>
<tr>
<td>Requires</td>
<td>Ethernet module has to be initialized. See SPI_Ethernet_Init. Available for PIC18 family MCUs only.</td>
</tr>
</tbody>
</table>
| Example   | `unsigned char gwIpAddr[4]; // user gateway IP address buffer ...`  
 `memcpy(gwIpAddr, SPI_Ethernet_getGwIpAddress(), 4); // fetch gateway IP address` |

### SPI_Ethernet_getDnsIpAddress

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned char * SPI_Ethernet_getDnsIpAddress();</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Pointer to the global variable holding DNS IP address.</td>
</tr>
<tr>
<td>Description</td>
<td>This routine should be used when DHCP server is present on the network to fetch assigned DNS IP address. <strong>Note:</strong> User should always copy the IP address from the RAM location returned by this routine into its own DNS IP address buffer. These locations should not be altered by the user in any case!</td>
</tr>
<tr>
<td>Requires</td>
<td>Ethernet module has to be initialized. See SPI_Ethernet_Init. Available for PIC18 family MCUs only.</td>
</tr>
</tbody>
</table>
| Example   | `unsigned char dnsIpAddr[4]; // user DNS IP address buffer ...`  
 `memcpy(dnsIpAddr, SPI_Ethernet_getDnsIpAddress(), 4); // fetch DNS server address` |
### SPI_Ethernet_getIpMask

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned char * SPI_Ethernet_getIpMask()</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Pointer to the global variable holding IP subnet mask.</td>
</tr>
<tr>
<td>Description</td>
<td>This routine should be used when DHCP server is present on the network to fetch assigned IP subnet mask.</td>
</tr>
<tr>
<td>Note</td>
<td>User should always copy the IP address from the RAM location returned by this routine into its own IP subnet mask buffer. These locations should not be altered by the user in any case.</td>
</tr>
<tr>
<td>Requires</td>
<td>Ethernet module has to be initialized. See SPI_Ethernet_Init. Available for PIC18 family MCUs only.</td>
</tr>
<tr>
<td>Example</td>
<td><code>unsigned char IpMask[4]; // user IP subnet mask buffer</code></td>
</tr>
<tr>
<td></td>
<td><code>...</code></td>
</tr>
<tr>
<td></td>
<td><code>memcpy(IpMask, SPI_Ethernet_getIpMask(), 4); // fetch IP subnet mask</code></td>
</tr>
</tbody>
</table>

### SPI_Ethernet_confNetwork

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void SPI_Ethernet_confNetwork(char *ipMask, char *gwIpAddr, char *dnsIpAddr);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Configures network parameters (IP subnet mask, gateway IP address, DNS IP address) when DHCP is not used.</td>
</tr>
<tr>
<td>Parameters:</td>
<td>- <code>ipMask</code>: IP subnet mask.</td>
</tr>
<tr>
<td></td>
<td>- <code>gwIpAddr</code>: gateway IP address.</td>
</tr>
<tr>
<td></td>
<td>- <code>dnsIpAddr</code>: DNS IP address.</td>
</tr>
<tr>
<td>Note</td>
<td>The above mentioned network parameters should be set by this routine only if DHCP module is not used. Otherwise DHCP will override these settings</td>
</tr>
<tr>
<td>Requires</td>
<td>Ethernet module has to be initialized. See SPI_Ethernet_Init. Available for PIC18 family MCUs only.</td>
</tr>
<tr>
<td>Example</td>
<td><code>char ipMask[4] = {255, 255, 255, 0}; // network mask (for example : 255.255.255.0)</code></td>
</tr>
<tr>
<td></td>
<td><code>char gwIpAddr[4] = {192, 168, 1, 1}; // gateway (router) IP address</code></td>
</tr>
<tr>
<td></td>
<td><code>char dnsIpAddr[4] = {192, 168, 1, 1}; // DNS server IP address</code></td>
</tr>
<tr>
<td></td>
<td><code>...</code></td>
</tr>
<tr>
<td></td>
<td><code>SPI_Ethernet_confNetwork(ipMask, gwIpAddr, dnsIpAddr); // set network configuration parameters</code></td>
</tr>
</tbody>
</table>
### SPI_Ethernet_arpResolve

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned char *SPI_Ethernet_arpResolve(unsigned char *ip, unsigned char tmax);</code></th>
</tr>
</thead>
</table>
| Returns   | - MAC address behind the IP address - the requested IP address was resolved.  
- 0 - otherwise. |
| Description | This is ARP module routine. It sends an ARP request for given IP address and waits for ARP reply. If the requested IP address was resolved, an ARP cash entry is used for storing the configuration. ARP cash can store up to 3 entries. For ARP cash structure refer to "eth_enc28j60LibDef.h" header file in the compiler's Uses/P18 folder. |
| Parameters: | 
- `ip`: IP address to be resolved.  
- `tmax`: time in seconds to wait for an reply. |
| Note | The Ethernet services are not stopped while this routine waits for ARP reply. The incoming packets will be processed normally during this time. |
| Requires | Ethernet module has to be initialized. See SPI_Ethernet_Init.  
Available for PIC18 family MCUs only. |
| Example | `unsigned char IpAddr[4] = {192, 168, 1, 1}; // IP address`  
`...`  
`SPI_Ethernet_arpResolve(IpAddr, 5); // get MAC address behind the above IP address, wait 5 secs for the response` |
### SPI_Ethernet_sendUDP

**Prototype**

```
unsigned char SPI_Ethernet_sendUDP(unsigned char *destIP, unsigned int sourcePort, unsigned int destPort, unsigned char *pkt, unsigned int pktLen);
```

**Returns**

- 1 - UDP packet was sent successfully.
- 0 - otherwise.

**Description**

This is UDP module routine. It sends an UDP packet on the network.

Parameters:

- `destIP`: remote host IP address.
- `sourcePort`: local UDP source port number.
- `destPort`: destination UDP port number.
- `pkt`: packet to transmit.
- `pktLen`: length in bytes of packet to transmit.

**Requires**

Ethernet module has to be initialized. See SPI_Ethernet_Init. Available for PIC18 family MCUs only.

**Example**

```c
unsigned char IpAddr[4] = {192, 168, 1, 1}; // remote IP address
...
SPI_Ethernet_sendUDP(IpAddr, 10001, 10001, "Hello", 5); // send Hello message to the above IP address, from UDP port 10001 to UDP port 10001
```
### SPI_Ethernet_dnsResolve

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned char * SPI_Ethernet_dnsResolve(unsigned char *host, unsigned char tmax);</code></th>
</tr>
</thead>
</table>
| Returns   | - pointer to the location holding the IP address - the requested host name was resolved.  
- 0 - otherwise. |
| Description | This is DNS module routine. It sends an DNS request for given host name and waits for DNS reply. If the requested host name was resolved, it's IP address is stored in library global variable and a pointer containing this address is returned by the routine. UDP port 53 is used as DNS port. Parameters:  
-`host`: host name to be resolved.  
-`tmax`: time in seconds to wait for an reply.  
**Note**: The Ethernet services are not stopped while this routine waits for DNS reply. The incoming packets will be processed normaly during this time.  
**Note**: User should always copy the IP address from the RAM location returned by this routine into it's own resolved host IP address buffer. These locations should not be altered by the user in any case. |
| Requires  | Ethernet module has to be initialized. See SPI_Ethernet_Init. Available for PIC18 family MCUs only. |
| Example   | `unsigned char * remoteHostIpAddr[4];  // user host IP address buffer  
...  
// SNTP server:  
// Zurich, Switzerland: Integrated Systems Lab, Swiss Fed. Inst. of Technology  
// 129.132.2.21: swisstime.ethz.ch  
// Service Area: Switzerland and Europe  
memcpy(remoteHostIpAddr,  
SPI_Ethernet_dnsResolve("swisstime.ethz.ch", 5), 4);` |
## SPI_Ethernet_initDHCP

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned char SPI_Ethernet_initDHCP(unsigned char tmax);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>- 1 - network parameters were obtained successfully.</td>
</tr>
<tr>
<td></td>
<td>- 0 - otherwise.</td>
</tr>
<tr>
<td>Description</td>
<td>This is DHCP module routine. It sends an DHCP request for network parameters (IP, gateway, DNS addresses and IP subnet mask) and waits for DHCP reply. If the requested parameters were obtained successfully, their values are stored into the library global variables.</td>
</tr>
<tr>
<td></td>
<td>These parameters can be fetched by using appropriate library IP get routines:</td>
</tr>
<tr>
<td></td>
<td>- SPI_Ethernet_getIpAddress - fetch IP address.</td>
</tr>
<tr>
<td></td>
<td>- SPI_Ethernet_getGwIpAddress - fetch gateway IP address.</td>
</tr>
<tr>
<td></td>
<td>- SPI_Ethernet_getDnsIpAddress - fetch DNS IP address.</td>
</tr>
<tr>
<td></td>
<td>- SPI_Ethernet_getIpMask - fetch IP subnet mask.</td>
</tr>
<tr>
<td>UDP port</td>
<td>68 is used as DHCP client port and UDP port 67 is used as DHCP server port.</td>
</tr>
<tr>
<td>Parameters:</td>
<td>- <code>tmax</code>: time in seconds to wait for an reply.</td>
</tr>
<tr>
<td>Note:</td>
<td>The Ethernet services are not stopped while this routine waits for DNS reply. The incoming packets will be processed normally during this time.</td>
</tr>
<tr>
<td>Note:</td>
<td>When DHCP module is used, global library variable <code>SPI_Ethernet_userTimerSec</code> is used to keep track of time. It is user responsibility to increment this variable each second in it's code.</td>
</tr>
<tr>
<td>Requires</td>

### SPI_Ethernet_doDHCPLeaseTime

**Prototype**

```
unsigned char SPI_Ethernet_doDHCPLeaseTime();
```

**Returns**

- 0 - lease time has not expired yet.
- 1 - lease time has expired, it's time to renew it.

**Description**

This is DHCP module routine. It takes care of IP address lease time by decrementing the global lease time library counter. When this time expires, it's time to contact DHCP server and renew the lease.

**Requires**

Ethernet module has to be initialized. See SPI_Ethernet_Init. Available for PIC18 family MCUs only.

**Example**

```
while(1) {
    ...
    if(SPI_Ethernet_doDHCPLeaseTime())
        ... // it's time to renew the IP address lease
}
```

### SPI_Ethernet_renewDHCP

**Prototype**

```
unsigned char SPI_Ethernet_renewDHCP(unsigned char tmax);
```

**Returns**

- 1 - upon success (lease time was renewed).
- 0 - otherwise (renewal request timed out).

**Description**

This is DHCP module routine. It sends IP address lease time renewal request to DHCP server.

**Parameters:**

- `tmax`: time in seconds to wait for an reply.

**Requires**

Ethernet module has to be initialized. See SPI_Ethernet_Init. Available for PIC18 family MCUs only.

**Example**

```
while(1) {
    ...
    if(SPI_Ethernet_doDHCPLeaseTime())
        SPI_Ethernet_renewDHCP(5); // it's time to renew the IP address lease, with 5 secs for a reply
        ...
}
```
Library Example

This code shows how to use the Ethernet mini library:

- the board will reply to ARP & ICMP echo requests
- the board will reply to UDP requests on any port:
  returns the request in upper char with a header made of remote host IP & port number
- the board will reply to HTTP requests on port 80, GET method with pathnames:
  / will return the HTML main page
  /s will return board status as text string
  /t0 ... /t7 will toggle RD0 to RD7 bit and return HTML main page
  all other requests return also HTML main page.

SPI GRAPHIC LCD LIBRARY

The *mikroC PRO for PIC* provides a library for operating Graphic Lcd 128x64 (with commonly used Samsung KS108/KS107 controller) via SPI interface.

For creating a custom set of Glcd images use Glcd Bitmap Editor Tool.

**Note:** The library uses the SPI module for communication. User must initialize SPI module before using the SPI Graphic Lcd Library.

For MCUs with two SPI modules it is possible to initialize both of them and then switch by using the `SPI_Set_Active()` routine.

**Note:** This Library is designed to work with the mikroElektronika's Serial Lcd/Glcd Adapter Board pinout, see schematic at the bottom of this page for details.

External dependencies of SPI Graphic LCD Library

The implementation of SPI Graphic Lcd Library routines is based on Port Expander Library routines.

External dependencies are the same as Port Expander Library external dependencies.

Library Routines

Basic routines:

- SPI_Glcd_Init
- SPI_Glcd_Set_Side
- SPI_Glcd_Set_Page
- SPI_Glcd_Set_X
- SPI_Glcd_Read_Data
- SPI_Glcd_Write_Data

Advanced routines:

- SPI_Glcd_Fill
- SPI_Glcd_Dot
- SPI_Glcd_Line
- SPI_Glcd_V_Line
- SPI_Glcd_H_Line
- SPI_Glcd_Rectangle
- SPI_Glcd_Box
- SPI_Glcd_Circle
 Spi_Glcd_Init

 Prototype | void SPI_Glcd_Init(char DeviceAddress);
 Returns | Nothing.
 Description | Initializes the GLCD module via SPI interface.
 Parameters: | - DeviceAddress: spi expander hardware address, see schematic at the bottom of this page
 Requires | Global variables:
 | - SPExpanderCS: Chip Select line
 | - SPExpanderRST: Reset line
 | - SPExpanderCS_Direction: Direction of the Chip Select pin
 | - SPExpanderRST_Direction: Direction of the Reset pin
 must be defined before using this function.

 The SPI module needs to be initialized. See SPI1_Init and SPI1_Init_Advanced routines.

 Example

```c
// Port Expander module connections
sbit SPExpanderRST at RC0_bit;
sbit SPExpanderCS at RC1_bit;
sbit SPExpanderRST_Direction at TRISC0_bit;
sbit SPExpanderCS_Direction at TRISC1_bit;
// End Port Expander module connections
...

// If Port Expander Library uses SPI module :
SPI1_Init(); // Initialize SPI module used with PortExpander
SPI_Glcd_Init(0);
```
### SPI_Glcd_Set_Side

**Prototype**
```c
void SPI_Glcd_Set_Side(char x_pos);
```

**Returns**
Nothing.

**Description**
Selects Glcd side. Refer to the Glcd datasheet for detail explanation.

Parameters:
- `x_pos`: position on x-axis. Valid values: 0..127

The parameter `x_pos` specifies the Glcd side: values from 0 to 63 specify the left side, values from 64 to 127 specify the right side.

**Note:** For side, x axis and page layout explanation see schematic at the bottom of this page.

**Requires**
Glcd needs to be initialized for SPI communication, see SPI_Glcd_Init routines.

**Example**
The following two lines are equivalent, and both of them select the left side of Glcd:
```c
SPI_Glcd_Set_Side(0);
SPI_Glcd_Set_Side(10);
```

### SPI_Glcd_Set_Page

**Prototype**
```c
void SPI_Glcd_Set_Page(char page);
```

**Returns**
Nothing.

**Description**
Selects page of Glcd.

Parameters:
- `page`: page number. Valid values: 0..7

**Note:** For side, x axis and page layout explanation see schematic at the bottom of this page.

**Requires**
Glcd needs to be initialized for SPI communication, see SPI_Glcd_Init routines.

**Example**
```c
SPI_Glcd_Set_Page(5);
```
### SPI_Glcd_Set_X

**Prototype**

```c
void SPI_Glcd_Set_X(char x_pos);
```

**Returns**

Nothing.

**Description**

Sets x-axis position to `x_pos` dots from the left border of Glcd within the selected side.

Parameters:

- `x_pos`: position on x-axis. Valid values: 0..63

**Note**: For side, x axis and page layout explanation see schematic at the bottom of this page.

**Requires**

Glcd needs to be initialized for SPI communication, see SPI_Glcd_Init routines.

**Example**

```c
SPI_Glcd_Set_X(25);
```

### Spi_Glcd_Read_Data

**Prototype**

```c
char SPI_Glcd_Read_Data();
```

**Returns**

One byte from Glcd memory.

**Description**

Reads data from the current location of Glcd memory and moves to the next location.

**Requires**

Glcd needs to be initialized for SPI communication, see SPI_Glcd_Init routines.

Glcd side, x-axis position and page should be set first. See the functions SPI_Glcd_Set_Side, SPI_Glcd_Set_X, and SPI_Glcd_Set_Page.

**Example**

```c
char data;
...
data = SPI_Glcd_Read_Data();
```
### SPI_Glcd_Write_Data

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void SPI_Glcd_Write_Data(char Ddata);</th>
</tr>
</thead>
<tbody>
<tr>

<td>- pattern: byte to fill Glcd memory with</td>
</tr>
<tr>
<td></td>
<td>To clear the Glcd screen, use SPI_Glcd_Fill(0).</td>
</tr>
<tr>
<td></td>
<td>To fill the screen completely, use SPI_Glcd_Fill(0xFF).</td>
</tr>
<tr>
<td>Requires</td>
<td>Glcd needs to be initialized for SPI communication, see SPI_Glcd_Init routines.</td>
</tr>
<tr>
<td>Example</td>
<td>// Clear screen</td>
</tr>
<tr>
<td></td>
<td>SPI_Glcd_Fill(0);</td>
</tr>
</tbody>
</table>
### SPI_Glcd_Dot

**Prototype**

```c
void SPI_Glcd_Dot(char x_pos, char y_pos, char color);
```

**Returns**

Nothing.

**Description**

Draws a dot on Glcd at coordinates \((x\_pos, y\_pos)\).

Parameters:

- \(x\_pos\): x position. Valid values: 0..127
- \(y\_pos\): y position. Valid values: 0..63
- \(color\): color parameter. Valid values: 0..2

The parameter \(color\) determines the dot state: 0 clears dot, 1 puts a dot, and 2 inverts dot state.

**Note:** For x and y axis layout explanation see schematic at the bottom of this page.

**Requires**

Glcd needs to be initialized for SPI communication, see SPI_Glcd_Init routines.

**Example**

```c
// Invert the dot in the upper left corner
SPI_Glcd_Dot(0, 0, 2);
```

---

### SPI_Glcd_Line

**Prototype**

```c
void SPI_Glcd_Line(int x_start, int y_start, int x_end, int y_end, char color);
```

**Returns**

Nothing.

**Description**

Draws a line on Glcd.

Parameters:

- \(x\_start\): x coordinate of the line start. Valid values: 0..127
- \(y\_start\): y coordinate of the line start. Valid values: 0..63
- \(x\_end\): x coordinate of the line end. Valid values: 0..127
- \(y\_end\): y coordinate of the line end. Valid values: 0..63
- \(color\): color parameter. Valid values: 0..2

Parameter \(color\) determines the line color: 0 white, 1 black, and 2 inverts each dot.

**Requires**

Glcd needs to be initialized for SPI communication, see SPI_Glcd_Init routines.

**Example**

```c
// Draw a line between dots (0,0) and (20,30)
SPI_Glcd_Line(0, 0, 20, 30, 1);
```
## SPI_Glcd_V_Line

### Prototype

```c
void SPI_Glcd_V_Line(char y_start, char y_end, char x_pos, char color);
```

### Returns

Nothing.

### Description

Draws a vertical line on Glcd.

**Parameters:**

- `y_start`: y coordinate of the line start. Valid values: 0..63
- `y_end`: y coordinate of the line end. Valid values: 0..63
- `x_pos`: x coordinate of vertical line. Valid values: 0..127
- `color`: color parameter. Valid values: 0..2

Parameter `color` determines the line color: 0 white, 1 black, and 2 inverts each dot.

### Requires

Glcd needs to be initialized for SPI communication, see SPI_Glcd_Init routines.

### Example

```c
// Draw a vertical line between dots (10,5) and (10,25)
SPI_Glcd_V_Line(5, 25, 10, 1);
```

## SPI_Glcd_H_Line

### Prototype

```c
void SPI_Glcd_H_Line(char x_start, char x_end, char y_pos, char color);
```

### Returns

Nothing.

### Description

Draws a horizontal line on Glcd.

**Parameters:**

- `x_start`: x coordinate of the line start. Valid values: 0..127
- `x_end`: x coordinate of the line end. Valid values: 0..127
- `y_pos`: y coordinate of horizontal line. Valid values: 0..63
- `color`: color parameter. Valid values: 0..2

The parameter `color` determines the line color: 0 white, 1 black, and 2 inverts each dot.

### Requires

Glcd needs to be initialized for SPI communication, see SPI_Glcd_Init routines.

### Example

```c
// Draw a horizontal line between dots (10,20) and (50,20)
SPI_Glcd_H_Line(10, 50, 20, 1);
```
### SPI_Glcd_Rectangle

**Prototype**

```c
void SPI_Glcd_Rectangle(char x_upper_left, char y_upper_left, char x_bottom_right, char y_bottom_right, char color);
```

<table>
<thead>
<tr>
<th>Returns</th>
<th>Nothing.</th>
</tr>
</thead>
</table>

**Description**

Draws a rectangle on Glcd.

Parameters:
- `x_upper_left`: x coordinate of the upper left rectangle corner. Valid values: 0..127
- `y_upper_left`: y coordinate of the upper left rectangle corner. Valid values: 0..63
- `x_bottom_right`: x coordinate of the lower right rectangle corner. Valid values: 0..127
- `y_bottom_right`: y coordinate of the lower right rectangle corner. Valid values: 0..63
- `color`: color parameter. Valid values: 0..2

The parameter `color` determines the color of the rectangle border: 0 white, 1 black, and 2 inverts each dot.

**Requires**

GLCD needs to be initialized for SPI communication, see Spi_Glcd_Init routines.

**Example**

```c
// Draw a box between dots (5,15) and (20,40)
SPI_Glcd_Box(5, 15, 20, 40, 1);
```

### SPI_Glcd_Box

**Prototype**

```c
void SPI_Glcd_Box(char x_upper_left, char y_upper_left, char x_bottom_right, char y_bottom_right, char color);
```

<table>
<thead>
<tr>
<th>Returns</th>
<th>Nothing.</th>
</tr>
</thead>
</table>

**Description**

Draws a box on Glcd.

Parameters:
- `x_upper_left`: x coordinate of the upper left box corner. Valid values: 0..127
- `y_upper_left`: y coordinate of the upper left box corner. Valid values: 0..63
- `x_bottom_right`: x coordinate of the lower right box corner. Valid values: 0..127
- `y_bottom_right`: y coordinate of the lower right box corner. Valid values: 0..63
- `color`: color parameter. Valid values: 0..2

The parameter `color` determines the color of the box fill: 0 white, 1 black, and 2 inverts each dot.

**Requires**

Glcd needs to be initialized for SPI communication, see SPI_Glcd_Init routines.

**Example**

```c
// Draw a box between dots (5,15) and (20,40)
SPI_Glcd_Box(5, 15, 20, 40, 1);
```
### SPI_Glcd_Circle

**Prototype**
```c
void SPI_Glcd_Circle(int x_center, int y_center, int radius, char color);
```

**Returns**
Nothing.

**Description**
Draws a circle on Glcd.

**Parameters:**
- `x_center`: x coordinate of the circle center. Valid values: 0..127
- `y_center`: y coordinate of the circle center. Valid values: 0..63
- `radius`: radius size
- `color`: color parameter. Valid values: 0..2

The parameter `color` determines the color of the circle line: 0 white, 1 black, and 2 inverts each dot.

**Requires**
Glcd needs to be initialized for SPI communication, see SPI_Glcd_Init routine.

**Example**
```c
// Draw a circle with center in (50,50) and radius=10
SPI_Glcd_Circle(50, 50, 10, 1);
```

### SPI_Glcd_Set_Font

**Prototype**
```c
void SPI_Glcd_Set_Font(const code char *activeFont, char aFontWidth, char aFontHeight, unsigned int aFontOffs);
```

**Returns**
Nothing.

**Description**
Sets font that will be used with SPI_Glcd_Write_Char and SPI_Glcd_Write_Text routines.

**Parameters:**
- `activeFont`: font to be set. Needs to be formatted as an array of char
- `aFontWidth`: width of the font characters in dots.
- `aFontHeight`: height of the font characters in dots.
- `aFontOffs`: number that represents difference between the mikroC PRO character set and regular ASCII set (eg. if 'A' is 65 in ASCII character, and 'A' is 45 in the mikroC PRO character set, aFontOffs is 20). Demo fonts supplied with the library have an offset of 32, which means that they start with space.

The user can use fonts given in the file "__Lib_Glcd_fonts" file located in the Uses folder or create his own fonts.

**Requires**
Glcd needs to be initialized for SPI communication, see SPI_Glcd_Init routines.

**Example**
```c
// Use the custom 5x7 font "myfont" which starts with space (32):
SPI_Glcd_Set_Font(myfont, 5, 7, 32);
```
# Spi_Glcd_Write_Char

<table>
<thead>
<tr>
<th>Prototype</th>
<th><strong>void</strong> SPI_Glcd_Write_Char(char chr1, char x_pos, char page_num, char color);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Prints character on GLCD.</td>
</tr>
<tr>
<td></td>
<td>Parameters:</td>
</tr>
<tr>
<td></td>
<td>- <strong>chr1</strong>: character to be written</td>
</tr>
<tr>
<td></td>
<td>- <strong>x_pos</strong>: character starting position on x-axis. Valid values: 0..(127-FontWidth)</td>
</tr>
<tr>
<td></td>
<td>- <strong>page_num</strong>: the number of the page on which character will be written. Valid values: 0..7</td>
</tr>
<tr>
<td></td>
<td>- <strong>color</strong>: color parameter. Valid values: 0..2</td>
</tr>
<tr>
<td></td>
<td>The parameter <strong>color</strong> determines the color of the character: 0 white, 1 black, and 2 inverts each dot.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: For x axis and page layout explanation see schematic at the bottom of this page.</td>
</tr>
</tbody>
</table>

| Requires   | Glcd needs to be initialized for SPI communication, see SPI_Glcd_Init routines. |
|           | Use the SPI_Glcd_Set_Font to specify the font for display; if no font is specified, then the default 5x8 font supplied with the library will be used. |

| Example   | // Write character 'C' on the position 10 inside the page 2: |
|           | SPI_Glcd_Write_Char('C', 10, 2, 1); |
# Spi_Glcd_Write_Text

## Prototype

```c
void SPI_Glcd_Write_Text(char text[], char x_pos, char page_num, char color);
```

## Returns

Nothing.

## Description

Prints text on GLCD.

**Parameters:**

- `text`: text to be written
- `x_pos`: text starting position on x-axis.
- `page_num`: the number of the page on which text will be written. Valid values: 0..7
- `color`: color parameter. Valid values: 0..2

The parameter `color` determines the color of the text: 0 white, 1 black, and 2 inverts each dot.

**Note:** For x axis and page layout explanation see schematic at the bottom of this page.

## Requires

GLcd needs to be initialized for SPI communication, see SPI_Glcd_Init routines.

Use the SPI_Glcd_Set_Font to specify the font for display; if no font is specified, then the default 5x8 font supplied with the library will be used.

## Example

```c
// Write text "Hello world!" on the position 10 inside the page 2:
SPI_Glcd_Write_Text("Hello world!", 10, 2, 1);
```
Library Example

The example demonstrates how to communicate to KS0108 Glcd via the SPI module, using serial to parallel convertor MCP23S17.

```c
const code char truck_bmp[1024];

// Port Expander module connections
sbit SPExpanderRST at RC0_bit;
sbit SPExpanderCS at RC1_bit;
sbit SPExpanderRST_Direction at TRISC0_bit;
sbit SPExpanderCS_Direction at TRISC1_bit;
// End Port Expander module connections

void Delay2s(){                         // 2 seconds delay function
    Delay_ms(2000);
}

void main() {
    char *someText;
    char counter;

    // If Port Expander Library uses SPI1 module
    SPI1_Init();        // Initialize SPI module used with PortExpander

    // Draw image my_image on Glcd
    SPI_Glcd_Image(my_image);
```
SPI_Init();  // Initialize SPI module used with PortExpander

SPI_Glcd_Init(0);       // Initialize Glcd via SPI
SPI_Glcd_Fill(0x00);    // Clear Glcd

while(1) {

  SPI_Glcd_Image(truck_bmp);                  // Draw image
  Delay2s();       Delay2s();

  SPI_Glcd_Fill(0x00);                  // Clear Glcd
  Delay2s();

  SPI_Glcd_Box(62,40,124,56,1);            // Draw box
  SPI_Glcd_Rectangle(5,5,84,35,1);         // Draw rectangle
  SPI_Glcd_Line(0, 63, 127, 0,1);          // Draw line
  Delay2s();

  for(counter = 5; counter < 60; counter+=5 ) {  // Draw horizontal and vertical line
    Delay_ms(250);
    SPI_Glcd_V_Line(2, 54, counter, 1);
    SPI_Glcd_H_Line(2, 120, counter, 1);
  }
  Delay2s();

  SPI_Glcd_Fill(0x00);                      // Clear Glcd
  SPI_Glcd_Set_Font(Character8x7, 8, 8, 32);   // Choose font, see __Lib_GLCDFonts.c in Uses folder
  SPI_Glcd_Write_Text("mikroE", 5, 7, 2);     // Write string

  for (counter = 1; counter <= 10; counter++)  // Draw circles
    SPI_Glcd_Circle(63,32, 3*counter, 1);
  Delay2s();

  SPI_Glcd_Box(12,20, 70,63, 2);            // Draw box
  Delay2s();

  SPI_Glcd_Fill(0xFF);                        // Fill Glcd

  SPI_Glcd_Set_Font(Character8x7, 8, 7, 32);  // Change font
  someText = "8x7 Font";
  SPI_Glcd_Write_Text(someText, 5, 1, 2);    // Write string
  Delay2s();

  SPI_Glcd_Set_Font(System3x5, 3, 5, 32);    // Change font
  someText = "3X5 CAPITALS ONLY";
  SPI_Glcd_Write_Text(someText, 5, 3, 2);    // Write string
  Delay2s();

SPI_Glcd_Set_Font(font5x7, 5, 7, 32);  // Change font
someText = "5x7 Font";
SPI_Glcd_Write_Text(someText, 5, 5, 2);  // Write string
Delay2s();

SPI_Glcd_Set_Font(FontSystem5x7_v2, 5, 7, 32); // Change font
someText = "5x7 Font (v2)";
SPI_Glcd_Write_Text(someText, 5, 7, 2);  // Write string
Delay2s();

**SPI LCD LIBRARY**

The *mikroC PRO for PIC* provides a library for communication with Lcd (with HD44780 compliant controllers) in 4-bit mode via SPI interface.

For creating a custom set of Lcd characters use Lcd Custom Character Tool.

**Note:** The library uses the SPI module for communication. The user must initialize the SPI module before using the SPI Lcd Library. For MCUs with two SPI modules it is possible to initialize both of them and then switch by using the `SPI_Set_Active()` routine.

**Note:** This Library is designed to work with the mikroElektronika's Serial Lcd Adapter Board pinout. See schematic at the bottom of this page for details.

**External dependencies of SPI LCD Library**

The implementation of SPI Lcd Library routines is based on Port Expander Library routines.

External dependencies are the same as Port Expander Library external dependencies.

**Library Routines**

- SPI_Lcd_Config
- SPI_Lcd_Out
- SPI_Lcd_Out_Cp
- SPI_Lcd_Cmd
- SPI_Lcd_Chr
- SPI_Lcd_Chr_Cp
- SPI_Lcd_Cmd

</table>
**Library Example**

This example demonstrates how to communicate Lcd via the SPI module, using serial to parallel convertor MCP23S17.

```c
char *text = "mikroElektronika";

// Port Expander module connections
sbit SPExpanderRST at RC0_bit;
sbit SPExpanderCS at RC1_bit;
sbit SPExpanderRST_Direction at TRISC0_bit;
sbit SPExpanderCS_Direction at TRISC1_bit;
// End Port Expander module connections

void main() {

    // If Port Expander Library uses SPI1 module
    SPI1_Init();     // Initialize SPI module used with PortExpander

    // If Port Expander Library uses SPI2 module
    // SPI2_Init(); // Initialize SPI module used with PortExpander

    SPI_Lcd_Config(0);      // Initialize Lcd over SPI interface
    SPI_Lcd_Cmd(_LCD_CLEAR);     // Clear display
    SPI_Lcd_Cmd(_LCD_CURSOR_OFF); // Turn cursor off
    SPI_Lcd_Out(1, 6, "mikroE");   // Print text to Lcd, 1st row, 6th column
    SPI_Lcd_Chr_CP('!');                   // Append '!
    SPI_Lcd_Out(2, 1, text); // Print text to Lcd, 2nd row, 1st column

    // SPI_Lcd_Out(3,1,"mikroE");   // For Lcd with more than two rows
    // SPI_Lcd_Out(4,15,"mikroE");  // For Lcd with more than two rows
}
```

SPI LCD HW connection
SPI LCD8 (8-BIT INTERFACE) LIBRARY

The *mikroC PRO for PIC* provides a library for communication with Lcd (with HD44780 compliant controllers) in 8-bit mode via SPI interface.

For creating a custom set of Lcd characters use Lcd Custom Character Tool.

**Note:** Library uses the SPI module for communication. The user must initialize the SPI module before using the SPI Lcd Library. For MCUs with two SPI modules it is possible to initialize both of them and then switch by using the `SPI_Set_Active()` routine.

**Note:** This Library is designed to work with mikroElektronika's Serial Lcd/Glcd Adapter Board pinout, see schematic at the bottom of this page for details.

External dependencies of SPI LCD Library

The implementation of SPI Lcd Library routines is based on Port Expander Library routines.

External dependencies are the same as Port Expander Library external dependencies.

Library Routines

- SPI_Lcd8_Config
- SPI_Lcd8_Out
- SPI_Lcd8_Out_Cp
- SPI_Lcd8_Chr
- SPI_Lcd8_Chr_Cp
- SPI_Lcd8_Cmd
## Spi_Lcd8_Config

**Prototype**

```c
void SPI_Lcd8_Config(char DeviceAddress);
```

**Returns**

Nothing.

**Description**

Initializes the LCD module via SPI interface.

**Parameters:**
- `DeviceAddress`: spi expander hardware address, see schematic at the bottom of this page

**Requires**

Global variables:
- `SPIExpanderCS`: Chip Select line
- `SPIExpanderRST`: Reset line
- `SPIExpanderCS_Direction`: Direction of the Chip Select pin
- `SPIExpanderRST_Direction`: Direction of the Reset pin

must be defined before using this function.

The SPI module needs to be initialized. See SPI1_Init and SPI1_Init_Advanced routines.

**Example**

```c
// Port Expander module connections
sbit SPIExpanderRST at RC0_bit;
sbit SPIExpanderCS at RC1_bit;
sbit SPIExpanderRST_Direction at TRISC0_bit;
sbit SPIExpanderCS_Direction at TRISC1_bit;
// End Port Expander module connections
...
// If Port Expander Library uses SPI module
SPI1_Init(); // Initialize SPI module used with PortExpander
SPI_Lcd8_Config(0); // initialize Lcd in 8bit mode via SPI
```

## Spi_Lcd8_Out

**Prototype**

```c
void SPI_Lcd8_Out(unsigned short row, unsigned short column, char *text);
```

**Returns**

Nothing.

**Description**

Prints text on LCD starting from specified position. Both string variables and literals can be passed as a text.

**Parameters:**
- `row`: starting position row number
- `column`: starting position column number
- `text`: text to be written

**Requires**

Lcd needs to be initialized for SPI communication, see SPI_Lcd8_Config routines.

**Example**

```c
// Write text "Hello!" on Lcd starting from row 1, column 3:
SPI_Lcd8_Out(1, 3, "Hello!");
```
### Spi_Lcd8_Out_Cp

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void SPI_Lcd8_Chr_CP(char out_char);</code></th>

SPI T6963C GRAPHIC LCD LIBRARY

The *mikroC PRO for PIC* provides a library for working with Glclds based on TOSHIBA T6963C controller via SPI interface. The Toshiba T6963C is a very popular Lcd controller for the use in small graphics modules. It is capable of controlling displays with a resolution up to 240x128. Because of its low power and small outline it is most suitable for mobile applications such as PDAs, MP3 players or mobile measurement equipment. Although this controller is small, it has a capability of displaying and merging text and graphics and it manages all interfacing signals to the displays Row and Column drivers.

For creating a custom set of Glcd images use Glcd Bitmap Editor Tool.

**Note**: The library uses the SPI module for communication. The user must initialize SPI module before using the SPI T6963C Glcd Library. For MCUs with two SPI modules it is possible to initialize both of them and then switch by using the `SPI_Set_Active()` routine.

**Note**: This Library is designed to work with mikroElektronika's Serial Glcd 240x128 and 240x64 Adapter Boards pinout, see schematic at the bottom of this page for details.

**Note**: Some mikroElektronika's adapter boards have pinout different from T6369C datasheets. Appropriate relations between these labels are given in the table below:

<table>
<thead>
<tr>
<th>Adapter Board</th>
<th>T6369C datasheet</th>
</tr>
</thead>
<tbody>
<tr>
<td>RS</td>
<td>C/D</td>
</tr>
<tr>
<td>R/W</td>
<td>/RD</td>
</tr>
<tr>
<td>E</td>
<td>/WR</td>
</tr>
</tbody>
</table>

**External dependencies of Spi T6963C Graphic LCD Library**

The implementation of SPI T6963C Graphic Lcd Library routines is based on Port Expander Library routines.

External dependencies are the same as Port Expander Library external dependencies.
Library Routines

- SPI_T6963C_Config
- SPI_T6963C_writeData
- SPI_T6963C_writeCommand
- SPI_T6963C_setPtr
- SPI_T6963C_waitReady
- SPI_T6963C_fill
- SPI_T6963C_dot
- SPI_T6963C_write_char
- SPI_T6963C_write_text
- SPI_T6963C_line
- SPI_T6963C_rectangle
- SPI_T6963C_box
- SPI_T6963C_circle
- SPI_T6963C_image
- SPI_T6963C_sprite
- SPI_T6963C_set_cursor
- SPI_T6963C_clearBit
- SPI_T6963C_setBit
- SPI_T6963C_negBit

Note: The following low level library routines are implemented as macros. These macros can be found in the SPI_T6963C.h header file which is located in the SPI T6963C example projects folders.

- SPI_T6963C_displayGrPanel
- SPI_T6963C_displayTxtPanel
- SPI_T6963C_setGrPanel
- SPI_T6963C_setTxtPanel
- SPI_T6963C_panelFill
- SPI_T6963C_grFill
- SPI_T6963C_txtFill
- SPI_T6963C_cursor_height
- SPI_T6963C_graphics
- SPI_T6963C_text
- SPI_T6963C_cursor
- SPI_T6963C_cursor_blink
### Spi_T6963C_Config

**Prototype**

| void SPI_T6963C_Config(unsigned int width, unsigned char height, unsigned char fntW, char DeviceAddress, unsigned char wr, unsigned char rd, unsigned char cd, unsigned char rst); |

**Returns**

Nothing.

**Description**

Initializes the Graphic Lcd controller.

**Parameters:**

- **width**: width of the GLCD panel
- **height**: height of the GLCD panel
- **fntW**: font width
- **DeviceAddress**: SPI expander hardware address, see schematic at the bottom of this page
- **wr**: write signal pin on GLCD control port
- **rd**: read signal pin on GLCD control port
- **cd**: command/data signal pin on GLCD control port
- **rst**: reset signal pin on GLCD control port

**Display RAM organization:**

The library cuts RAM into panels: a complete panel is one graphics panel followed by a text panel (see schematic below).

```
schematic:

### Spi_T6963C_WriteData

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void SPI_T6963C_writeData(unsigned char Ddata);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Writes data to T6963C controller via SPI interface.</td>
</tr>
<tr>
<td>Parameters:</td>
<td>- <code>Ddata</code>: data to be written</td>
</tr>
<tr>
<td>Requires</td>
<td>Toshiba Glcd module needs to be initialized. See SPI_T6963C_Config routine.</td>
</tr>
<tr>
<td>Example</td>
<td><code>SPI_T6963C_writeData(AddrL);</code></td>
</tr>
</tbody>
</table>

### Spi_T6963C_WriteCommand

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void SPI_T6963C_writeCommand(unsigned char Ddata);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Writes command to T6963C controller via SPI interface.</td>
</tr>
<tr>
<td>Parameters:</td>
<td>- <code>Ddata</code>: command to be written</td>
</tr>
<tr>
<td>Requires</td>
<td>Toshiba Glcd module needs to be initialized. See SPI_T6963C_Config routine.</td>
</tr>
<tr>
<td>Example</td>
<td><code>SPI_T6963C_writeCommand(SPI_T6963C_CURSOR_POINTER_SET);</code></td>
</tr>
</tbody>
</table>
### Spi_T6963C_SetPtr

**Prototype**

```c
void SPI_T6963C_setPtr(unsigned int p, unsigned char c);
```

**Returns**

Nothing.

**Description**

Sets the memory pointer \( p \) for command \( c \).

**Parameters:**

- \( p \): address where command should be written
- \( c \): command to be written

**Requires**

SToshiba Glcd module needs to be initialized. See SPI_T6963C_Config routine.

**Example**

```c
SPI_T6963C_setPtr(T6963C_grHomeAddr + start, T6963C_ADDRESS_POINTER_SET);
```

### Spi_T6963C_WaitReady

**Prototype**

```c
void SPI_T6963C_waitReady(void);
```

**Returns**

Nothing.

**Description**

Pools the status byte, and loops until Toshiba Glcd module is ready.

**Requires**

Toshiba Glcd module needs to be initialized. See SPI_T6963C_Config routine.

**Example**

```c
SPI_T6963C_waitReady();
```

### Spi_T6963C_Fill

**Prototype**

```c
void SPI_T6963C_fill(unsigned char v, unsigned int start, unsigned int len);
```

**Returns**

Nothing.

**Description**

Fills controller memory block with given byte.

**Parameters:**

- \( v \): byte to be written
- \( \text{start} \): starting address of the memory block
- \( \text{len} \): length of the memory block in bytes

**Requires**

Toshiba Glcd module needs to be initialized. See SPI_T6963C_Config routine.

**Example**

```c
SPI_T6963C_fill(0x33,0x00FF,0x000F);
```
### Spi_T6963C_Dot

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void SPI_T6963C_dot(int x, int y, unsigned char color);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Draws a dot in the current graphic panel of GLCD at coordinates (x, y). Parameters:</td>
</tr>
<tr>
<td></td>
<td>- <code>x</code>: dot position on x-axis</td>
</tr>
<tr>
<td></td>
<td>- <code>y</code>: dot position on y-axis</td>
</tr>
<tr>
<td></td>
<td>- <code>color</code>: color parameter. Valid values: Spi_T6963C_BLACK and Spi_T6963C_WHITE</td>
</tr>
<tr>
<td>Requires</td>
<td>Toshiba Glcd module needs to be initialized. See SPI_T6963C_Config routine.</td>
</tr>
<tr>
<td>Example</td>
<td><code>SPI_T6963C_dot(x0, y0, pcolor);</code></td>
</tr>
</tbody>
</table>
## Spi_T6963C_Write_Char

### Prototype

```c
void SPI_T6963C_write_char(unsigned char c, unsigned char x, unsigned char y, unsigned char mode);
```

### Returns

Nothing.

### Description

Writes a char in the current text panel of GLCD at coordinates (x, y).

**Parameters:**

- `c`: char to be written
- `x`: char position on x-axis
- `y`: char position on y-axis
- `mode`: mode parameter. Valid values:

  - SPI_T6963C_ROM_MODE_OR, SPI_T6963C_ROM_MODE_XOR,
  - SPI_T6963C_ROM_MODE_AND and
  - SPI_T6963C_ROM_MODE_TEXT

**Mode parameter explanation:**

- **OR Mode**: In the OR-Mode, text and graphics can be displayed and the data is logically “OR-ed”. This is the most common way of combining text and graphics for example labels on buttons.
- **XOR-Mode**: In this mode, the text and graphics data are combined via the logical “exclusive OR”. This can be useful to display text in negative mode, i.e. white text on black background.
- **AND-Mode**: The text and graphic data shown on display are combined via the logical “AND function”.
- **TEXT-Mode**: This option is only available when displaying just a text. The Text Attribute values are stored in the graphic area of display memory.

For more details see the T6963C datasheet.

### Requires

Toshiba Glcd module needs to be initialized. See SPI_T6963C_Config routine.

### Example

```c
SPI_T6963C_write_char("A",22,23,AND);
```
### Spi_T6963C_write_Text

**Prototype**

```c
void SPI_T6963C_write_text(unsigned char *str, unsigned char x, unsigned char y, unsigned char mode);
```

**Returns**

Nothing.

**Description**

Writes text in the current text panel of GLCD at coordinates (x, y).

**Parameters:**

- **str:** text to be written
- **x:** text position on x-axis
- **y:** text position on y-axis
- **mode:** mode parameter. Valid values:
  - SPI_T6963C_ROM_MODE_OR
  - SPI_T6963C_ROM_MODE_XOR
  - SPI_T6963C_ROM_MODE_AND
  - SPI_T6963C_ROM_MODE_TEXT

**Mode parameter explanation:**

- **OR Mode:** In the OR-Mode, text and graphics can be displayed and the data is logically “OR-ed”. This is the most common way of combining text and graphics for example labels on buttons.
- **XOR-Mode:** In this mode, the text and graphics data are combined via the logical “exclusive OR”. This can be useful to display text in negative mode, i.e. white text on black background.
- **AND-Mode:** The text and graphic data shown on the display are combined via the logical “AND function”.
- **TEXT-Mode:** This option is only available when displaying just a text. The Text Attribute values are stored in the graphic area of display memory.

For more details see the T6963C datasheet.

**Requires**

Toshiba Glcd module needs to be initialized. See SPI_T6963C_Config routine.

**Example**

```c
SPI_T6963C_write_text("Glcd LIBRARY DEMO, WELCOME!", 0, 0, T6963C_ROM_MODE_EXOR);
```
### Spi_T6963C_line

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void SPI_T6963C_line(int x0, int y0, int x1, int y1, unsigned char pcolor);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Draws a line from (x0, y0) to (x1, y1).</td>
</tr>
<tr>
<td>Parameters:</td>
<td>- x0: x coordinate of the line start</td>
</tr>
<tr>
<td></td>
<td>- y0: y coordinate of the line end</td>
</tr>
<tr>
<td></td>
<td>- x1: x coordinate of the line start</td>
</tr>
<tr>
<td></td>
<td>- y1: y coordinate of the line end</td>
</tr>
<tr>
<td></td>
<td>- pcolor: color parameter. Valid values:</td>
</tr>
<tr>
<td></td>
<td>SPI_T6963C_BLACK and SPI_T6963C_WHITE</td>
</tr>
<tr>
<td>Requires</td>
<td>Toshiba Glcd module needs to be initialized. See SPI_T6963C_Config routine.</td>
</tr>
<tr>
<td>Example</td>
<td>SPI_T6963C_line(0, 0, 239, 127, T6963C_WHITE);</td>
</tr>
</tbody>
</table>

### Spi_T6963C_rectangle

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void SPI_T6963C_rectangle(int x0, int y0, int x1, int y1, unsigned char pcolor);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Draws a rectangle on GLCD.</td>
</tr>
<tr>
<td>Parameters:</td>
<td>- x0: x coordinate of the upper left rectangle corner</td>
</tr>
<tr>
<td></td>
<td>- y0: y coordinate of the upper left rectangle corner</td>
</tr>
<tr>
<td></td>
<td>- x1: x coordinate of the lower right rectangle corner</td>
</tr>
<tr>
<td></td>
<td>- y1: y coordinate of the lower right rectangle corner</td>
</tr>
<tr>
<td></td>
<td>- pcolor: color parameter. Valid values:</td>
</tr>
<tr>
<td></td>
<td>SPI_T6963C_BLACK and SPI_T6963C_WHITE</td>
</tr>
<tr>
<td>Requires</td>
<td>Toshiba Glcd module needs to be initialized. See SPI_T6963C_Config routine.</td>
</tr>
<tr>
<td>Example</td>
<td>SPI_T6963C_rectangle(20, 20, 219, 107, T6963C_WHITE);</td>
</tr>
</tbody>
</table>
### Spi_T6963C_box

**Prototype**

```c
void SPI_T6963C_box(int x0, int y0, int x1, int y1, unsigned char pcolor);
```

**Returns**

Nothing.

**Description**

Draws a box on the GLCD.

Parameters:

- `x0`: x coordinate of the upper left box corner
- `y0`: y coordinate of the upper left box corner
- `x1`: x coordinate of the lower right box corner
- `y1`: y coordinate of the lower right box corner
- `pcolor`: color parameter. Valid values: SPI_T6963C_BLACK and SPI_T6963C_WHITE

**Requires**

Toshiba Glcd module needs to be initialized. See SPI_T6963C_Config routine.

**Example**

```c
SPI_T6963C_box(0, 119, 239, 127, T6963C_WHITE);
```

### Spi_T6963C_circle

**Prototype**

```c
void SPI_T6963C_circle(int x, int y, long r, unsigned char pcolor);
```

**Returns**

Nothing.

**Description**

Draws a circle on the GLCD.

Parameters:

- `x`: x coordinate of the circle center
- `y`: y coordinate of the circle center
- `r`: radius size
- `pcolor`: color parameter. Valid values: SPI_T6963C_BLACK and SPI_T6963C_WHITE

**Requires**

Toshiba Glcd module needs to be initialized. See SPI_T6963C_Config routine.

**Example**

```c
SPI_T6963C_circle(120, 64, 110, T6963C_WHITE);
```
**Spi_T6963C_image**

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void SPI_T6963C_image(const code char *pic);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Displays bitmap on GLCD.</td>
</tr>
<tr>
<td>Description</td>
<td>Parameters:</td>
</tr>
<tr>
<td></td>
<td>- pic: image to be displayed. Bitmap array can be located in both code and RAM memory (due to the mikroC PRO for PIC pointer to const and pointer to RAM equivalency).</td>
</tr>
<tr>
<td></td>
<td>Use the mikroC PRO’s integrated Glcd Bitmap Editor (menu option Tools › Glcd Bitmap Editor) to convert image to a constant array suitable for displaying on Glcd.</td>
</tr>
<tr>
<td></td>
<td>Note: Image dimension must match the display dimension.</td>
</tr>
<tr>
<td>Requires</td>
<td>Toshiba Glcd module needs to be initialized. See SPI_T6963C_Config routine.</td>
</tr>
<tr>
<td>Example</td>
<td>SPI_T6963C_image(my_image);</td>
</tr>
</tbody>
</table>

**Spi_T6963C_Sprite**

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void SPI_T6963C_sprite(unsigned char px, unsigned char py, const code char *pic, unsigned char sx, unsigned char sy);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Fills graphic rectangle area (px, py) to (px+sx, py+sy) with custom size picture.</td>
</tr>
<tr>
<td>Description</td>
<td>Parameters:</td>
</tr>
<tr>
<td></td>
<td>- px: x coordinate of the upper left picture corner. Valid values: multiples of the font width</td>
</tr>
<tr>
<td></td>
<td>- py: y coordinate of the upper left picture corner</td>
</tr>
<tr>
<td></td>
<td>- pic: picture to be displayed</td>
</tr>
<tr>
<td></td>
<td>- sx: picture width. Valid values: multiples of the font width</td>
</tr>
<tr>
<td></td>
<td>- sy: picture height</td>
</tr>
<tr>
<td></td>
<td>Note: If px and sx parameters are not multiples of the font width they will be scaled to the nearest lower number that is a multiple of the font width.</td>
</tr>
<tr>
<td>Requires</td>
<td>Toshiba Glcd module needs to be initialized. See SPI_T6963C_Config routine.</td>
</tr>
<tr>
<td>Example</td>
<td>SPI_T6963C_sprite(76, 4, einstein, 88, 119); // draw a sprite</td>
</tr>
</tbody>
</table>
### Spi_T6963C_set_cursor

**Prototype**  
```c
void SPI_T6963C_set_cursor(unsigned char x, unsigned char y);
```

**Returns**  
Nothing.

**Description**  
Sets cursor to row x and column y.

**Parameters:**
- `x`: cursor position row number
- `y`: cursor position column number

**Requires**  
Toshiba Glcd module needs to be initialized. See SPI_T6963C_Config routine.

**Example**
```c
SPI_T6963C_set_cursor(cposx, cposy);
```

### Spi_T6963C_clearBit

**Prototype**  
```c
void SPI_T6963C_clearBit(char b);
```

**Returns**  
Nothing.

**Description**  
Clears control port bit(s).

**Parameters:**
- `b`: bit mask. The function will clear bit x on control port if bit x in bit mask is set to 1.

**Requires**  
Toshiba Glcd module needs to be initialized. See SPI_T6963C_Config routine.

**Example**
```c
// clear bits 0 and 1 on control port
SPI_T6963C_clearBit(0x03);
```

### Spi_T6963C_setBit

**Prototype**  
```c
void SPI_T6963C_setBit(char b);
```

**Returns**  
Nothing.

**Description**  
Sets control port bit(s).

**Parameters:**
- `b`: bit mask. The function will set bit x on control port if bit x in bit mask is set to 1.

**Requires**  
Toshiba Glcd module needs to be initialized. See SPI_T6963C_Config routine.

**Example**
```c
// set bits 0 and 1 on control port
SPI_T6963C_setBit(0x03);
```
### Spi_T6963C_negBit

**Prototype**

```c
void SPI_T6963C_negBit(char b);
```

**Returns**

Nothing.

**Description**

Negates control port bit(s).

**Parameters:**

- `b`: bit mask. The function will negate bit x on control port if bit x in bit mask is set to 1.

**Requires**

Toshiba Glcd module needs to be initialized. See SPI_T6963C_Config routine.

**Example**

```c
// negate bits 0 and 1 on control port
SPI_T6963C_negBit(0x03);
```

### Spi_T6963C_displayGrPanel

**Prototype**

```c
void SPI_T6963C_displayGrPanel(char n);
```

**Returns**

Nothing.

**Description**

Display selected graphic panel.

**Parameters:**

- `n`: graphic panel number. Valid values: 0 and 1.

**Requires**

Toshiba Glcd module needs to be initialized. See SPI_T6963C_Config routine.

**Example**

```c
// display graphic panel 1
SPI_T6963C_displayGrPanel(1);
```

### Spi_T6963C_displayTxtPanel

**Prototype**

```c
void SPI_T6963C_displayTxtPanel(char n);
```

**Returns**

Nothing.

**Description**

Display selected text panel.

**Parameters:**

- `n`: text panel number. Valid values: 0 and 1.

**Requires**

Toshiba Glcd module needs to be initialized. See SPI_T6963C_Config routine.

**Example**

```c
// display text panel 1
SPI_T6963C_displayTxtPanel(1);
```
### Spi_T6963C_setGrPanel

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void SPI_T6963C_setGrPanel(char n);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Compute start address for selected graphic panel and set appropriate internal pointers. All subsequent graphic operations will be preformed at this graphic panel.</td>
</tr>
<tr>
<td>Parameters:</td>
<td>- <code>n</code>: graphic panel number. Valid values: 0 and 1.</td>
</tr>
<tr>
<td>Requires</td>
<td>Toshiba Glcd module needs to be initialized. See SPI_T6963C_Config routine.</td>
</tr>
</tbody>
</table>
| Example | // set graphic panel 1 as current graphic panel.  
SPI_T6963C_setGrPanel(1); |

### Spi_T6963C_setTxtPanel

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void SPI_T6963C_setTxtPanel(char n);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Compute start address for selected text panel and set appropriate internal pointers. All subsequent text operations will be preformed at this text panel.</td>
</tr>
<tr>
<td>Parameters:</td>
<td>- <code>n</code>: text panel number. Valid values: 0 and 1.</td>
</tr>
<tr>
<td>Requires</td>
<td>Toshiba Glcd module needs to be initialized. See SPI_T6963C_Config routine.</td>
</tr>
</tbody>
</table>
| Example | // set text panel 1 as current text panel.  
SPI_T6963C_setTxtPanel(1); |
### Spi_T6963C_panelFill

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void SPI_T6963C_panelFill(unsigned char v);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Fill current panel in full (graphic+text) with appropriate value (0 to clear).</td>
</tr>
<tr>
<td>Parameters:</td>
<td>- ( v ): value to fill panel with.</td>
</tr>
<tr>
<td>Requires</td>
<td>Toshiba Glcd module needs to be initialized. See SPI_T6963C_Config routine.</td>
</tr>
<tr>
<td>Example</td>
<td>clear current panel</td>
</tr>
<tr>
<td></td>
<td>SPI_T6963C_panelFill(0);</td>
</tr>
</tbody>
</table>

### Spi_T6963C_grFill

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void SPI_T6963C_grFill(unsigned char v);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Fill current graphic panel with appropriate value (0 to clear).</td>
</tr>
<tr>
<td>Parameters:</td>
<td>- ( v ): value to fill graphic panel with.</td>
</tr>
<tr>
<td>Requires</td>
<td>Toshiba Glcd module needs to be initialized. See SPI_T6963C_Config routine.</td>
</tr>
<tr>
<td>Example</td>
<td>// clear current graphic panel</td>
</tr>
<tr>
<td></td>
<td>SPI_T6963C_grFill(0);</td>
</tr>
</tbody>
</table>

### Spi_T6963C_txtFill

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void SPI_T6963C_txtFill(unsigned char v);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Fill current text panel with appropriate value (0 to clear).</td>
</tr>
<tr>
<td>Parameters:</td>
<td>- ( v ): this value increased by 32 will be used to fill text panel.</td>
</tr>
<tr>
<td>Requires</td>
<td>Toshiba Glcd module needs to be initialized. See SPI_T6963C_Config routine.</td>
</tr>
<tr>
<td>Example</td>
<td>// clear current text panel</td>
</tr>
<tr>
<td></td>
<td>SPI_T6963C_txtFill(0);</td>
</tr>
</tbody>
</table>
### Spi_T6963C_cursor_height

**Prototype**  
```c
void SPI_T6963C_cursor_height(unsigned char n);
```

**Returns**  
Nothing.

**Description**  
Set cursor size.

**Parameters:**
- `n`: cursor height. Valid values: 0..7.

**Requires**  
Toshiba Glcd module needs to be initialized. See SPI_T6963C_Config routine.

**Example**  
```c
SPI_T6963C_cursor_height(7);
```

### Spi_T6963C_graphics

**Prototype**  
```c
void SPI_T6963C_graphics(char n);
```

**Returns**  
Nothing.

**Description**  
Enable/disable graphic displaying.

**Parameters:**
- `n`: graphic enable/disable parameter. Valid values: 0 (disable graphic displaying) and 1 (enable graphic displaying).

**Requires**  
Toshiba Glcd module needs to be initialized. See SPI_T6963C_Config routine.

**Example**  
```c
// enable graphic displaying
SPI_T6963C_graphics(1);
```

### Spi_T6963C_text

**Prototype**  
```c
void SPI_T6963C_text(char n);
```

**Returns**  
Nothing.

**Description**  
Enable/disable text displaying.

**Parameters:**
- `n`: text enable/disable parameter. Valid values: 0 (disable text displaying) and 1 (enable text displaying).

**Requires**  
Toshiba Glcd module needs to be initialized. See SPI_T6963C_Config routine.

**Example**  
```c
// enable text displaying
SPI_T6963C_text(1);
```

| Example            | // enable cursor blinking  
SPI_T6963C_cursor_blink(1); |

**Library Example**

The following drawing demo tests advanced routines of the SPI T6963C Glcd library. Hardware configurations in this example are made for the T6963C 240x128 display, EasyPIC5 board and 16F887.
```c
#include "__SPIT6963C.h"

/*
 * bitmap pictures stored in ROM
 */
extern const code char me[];
extern const code char einstein[];

// Port Expander module connections
sbit SPExpanderRST at RC0_bit;
sbit SPExpanderCS at RC1_bit;
sbit SPExpanderRST_Direction at TRISC0_bit;
sbit SPExpanderCS_Direction at TRISC1_bit;
// End Port Expander module connections

void main() {

    char txt1[] = " EINSTEIN WOULD HAVE LIKED mE";
    char txt[] = " GLCD LIBRARY DEMO, WELCOME !";

    unsigned char panel;       // current panel
    unsigned int i;           // general purpose register
    unsigned char curs;          // cursor visibility
    unsigned int cposx, cposy;  // cursor x-y position

    TRISA = 0xFF;               // Configure PORTA as input
    ANSEL  = 0;                 // Configure AN pins as digital I/O
    ANSELH = 0;

    // If Port Expander Library uses SPI1 module
    SPI1_Init();  // Initialize SPI module used with PortExpander

    // If Port Expander Library uses SPI2 module
    // SPI2_Init();  // Initialize SPI module used with PortExpander

    /*
    * init display for 240 pixel width and 128 pixel height
    * 8 bits character width
    * data bus on MCP23S17 portB
    * control bus on MCP23S17 portA
    * bit 2 is !WR
    * bit 1 is !RD
    * bit 0 is !CD
    * bit 4 is RST
    * chip enable, reverse on, 8x8 font internally set in library
    */

    SPI_T6963C_Config(240, 128, 8, 0, 2, 1, 0, 4);
    Delay_ms(1000);
}

SPI_T6963C_set_cursor(cposx, cposy);
Delay_ms(100);
HW Connection

Spi T6963C GLCD HW connection
T6963C GRAPHIC LCD LIBRARY

The *mikroC PRO for PIC* provides a library for working with Glcds based on TOSHIBA T6963C controller. The Toshiba T6963C is a very popular Lcd controller for the use in small graphics modules. It is capable of controlling displays with a resolution up to 240x128. Because of its low power and small outline it is most suitable for mobile applications such as PDAs, MP3 players or mobile measurement equipment. Although small, this controller has a capability of displaying and merging text and graphics and it manages all the interfacing signals to the displays Row and Column drivers.

For creating a custom set of Glcd images use Glcd Bitmap Editor Tool.

**Note**: ChipEnable(CE), FontSelect(FS) and Reverse(MD) have to be set to appropriate levels by the user outside of the `T6963C_init` function. See the Library Example code at the bottom of this page.

**Note**: Some mikroElektronika's adapter boards have pinout different from T6369C datasheets. Appropriate relations between these labels are given in the table below:

<table>
<thead>
<tr>
<th>Adapter Board</th>
<th>T6369C datasheet</th>
</tr>
</thead>
<tbody>
<tr>
<td>RS</td>
<td>C/D</td>
</tr>
<tr>
<td>R/W</td>
<td>/RD</td>
</tr>
<tr>
<td>E</td>
<td>/WR</td>
</tr>
</tbody>
</table>
The following variables must be defined in all projects using T6963C Graphic LCD library:

<table>
<thead>
<tr>
<th>Description:</th>
<th>Example:</th>
</tr>
</thead>
<tbody>
<tr>
<td>T6963C Data Port.</td>
<td><code>char T6963C_dataPort at PORTD;</code></td>
</tr>
<tr>
<td>Write signal.</td>
<td><code>sbit T6963C_ctrlwr at RC2_bit;</code></td>
</tr>
<tr>
<td>Read signal.</td>
<td><code>sbit T6963C_ctrlrd at RC1_bit;</code></td>

// Signals not used by library, they are set in main function
sbit T6963C_ctrlce at RC3_bit;       // CE signal
sbit T6963C_ctrlfs at RC6_bit;       // FS signal
sbit T6963C_ctrlmd at RC5_bit;       // MD signal
sbit T6963C_ctrlce_Direction at TRISC3_bit;// CE signal direction
sbit T6963C_ctrlfs_Direction at TRISC6_bit; // FS signal direction
sbit T6963C_ctrlmd_Direction at TRISC5_bit; // MD signal direction
// End T6963C module connections

... // init display for 240 pixel width, 128 pixel height and 8 bits character width
T6963C_init(240, 128, 8);

T6963C_writeData

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void T6963C_writeData(unsigned char mydata);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Writes data to T6963C controller. Parameters:</td>
</tr>
<tr>
<td></td>
<td>- mydata: data to be written</td>
</tr>
<tr>
<td>Requires</td>
<td>Toshiba Glcd module needs to be initialized. See the T6963C_init routine.</td>
</tr>
<tr>
<td>Example</td>
<td>T6963C_writeData(AddrL);</td>
</tr>
</tbody>
</table>
### T6963C_WriteCommand

**Prototype**

```c
void T6963C_writeCommand(unsigned char mydata);
```

**Returns**

Nothing.

**Description**

Writes command to T6963C controller.

**Parameters:**

- `mydata`: command to be written

**Requires**

Toshiba Glcd module needs to be initialized. See the T6963C_init routine.

**Example**

```c
T6963C_writeCommand(T6963C_CURSOR_POINTER_SET);
```

### T6963C_SetPtr

**Prototype**

```c
void T6963C_setPtr(unsigned int p, unsigned char c);
```

**Returns**

Nothing.

**Description**

Sets the memory pointer `p` for command `c`.

**Parameters:**

- `p`: address where command should be written
- `c`: command to be written

**Requires**

Toshiba Glcd module needs to be initialized. See the T6963C_init routine.

**Example**

```c
T6963C_setPtr(T6963C_grHomeAddr + start, T6963C_ADDRESS_POINTER_SET);
```

### T6963C_waitReady

**Prototype**

```c
void T6963C_waitReady(void);
```

**Returns**

Nothing.

**Description**

Pools the status byte, and loops until Toshiba GLCD module is ready.

**Requires**

Toshiba Glcd module needs to be initialized. See the T6963C_init routine.

**Example**

```c
T6963C_waitReady();
```
### T6963C_fill

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void T6963C_fill(unsigned char v, unsigned int start, unsigned int len);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Fills controller memory block with given byte.</td>
</tr>
<tr>
<td></td>
<td>Parameters:</td>
</tr>
<tr>
<td></td>
<td>- v: byte to be written</td>
</tr>
<tr>
<td></td>
<td>- start: starting address of the memory block</td>
</tr>
<tr>
<td></td>
<td>- len: length of the memory block in bytes</td>
</tr>
<tr>
<td>Requires</td>
<td>Toshiba Glcd module needs to be initialized. See the T6963C_init routine.</td>
</tr>
<tr>
<td>Example</td>
<td>T6963C_fill(0x33,0x00FF,0x000F);</td>
</tr>
</tbody>
</table>

### T6963C_Dot

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void T6963C_dot(int x, int y, unsigned char color);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Draws a dot in the current graphic panel of GLCD at coordinates (x, y).</td>
</tr>
<tr>
<td></td>
<td>Parameters:</td>
</tr>
<tr>
<td></td>
<td>- x: dot position on x-axis</td>
</tr>
<tr>
<td></td>
<td>- y: dot position on y-axis</td>
</tr>
<tr>
<td></td>
<td>- color: color parameter. Valid values: T6963C_BLACK and T6963C_WHITE</td>
</tr>
<tr>
<td>Requires</td>
<td>Toshiba Glcd module needs to be initialized. See the T6963C_init routine.</td>
</tr>
<tr>
<td>Example</td>
<td>T6963C_dot(x0, y0, pcolor);</td>
</tr>
</tbody>
</table>
## T6963C_write_Char

| Prototype | \[
void \text{T6963C\_write\_char}(\text{unsigned char} \ c, \text{unsigned char} \ x, \text{unsigned char} \ y, \text{unsigned char} \ \text{mode});
\] |
|---|---|
| Returns | \[
\text{Nothing.}
\] |
| Description | \[
\text{Writes a char in the current text panel of GLCD at coordinates } (x, y).
\]

**Parameters:**

- \(c\): char to be written
- \(x\): char position on x-axis
- \(y\): char position on y-axis
- \(\text{mode}\): mode parameter. Valid values: T6963C\_ROM\_MODE\_OR, T6963C\_ROM\_MODE\_XOR, T6963C\_ROM\_MODE\_AND and T6963C\_ROM\_MODE\_TEXT

**Mode parameter explanation:**

- **OR Mode:** In the OR-Mode, text and graphics can be displayed and the data is logically “OR-ed”. This is the most common way of combining text and graphics for example labels on buttons.
- **XOR-Mode:** In this mode, the text and graphics data are combined via the logical “exclusive OR”. This can be useful to display text in the negative mode, i.e. white text on black background. - **AND-Mode:** The text and graphic data shown on display are combined via the logical “AND function”. - **TEXT-Mode:** The text and graphic data shown on display are combined via the logical “AND function”. - **TEXT-Mode:** This option is only available when displaying just a text. The Text Attribute values are stored in the graphic area of display memory.

For more details see the T6963C datasheet.

<table>
<thead>
<tr>
<th>Requires</th>
<th>Toshiba Glcd module needs to be initialized. See the T6963C_init routine.</th>
</tr>
</thead>
</table>
| Example | \[
\text{T6963C\_write\_char}(\text{'A'}, 22, 23, \text{AND});
\] |
### T6963C_write_text

**Prototype**

```c
void T6963C_write_text(unsigned char *str, unsigned char x, unsigned char y, unsigned char mode);
```

**Returns**

Nothing.

**Description**

Writes text in the current text panel of GLCD at coordinates (x, y).

Parameters:

- `str`: text to be written
- `x`: text position on x-axis
- `y`: text position on y-axis
- `mode`: mode parameter. Valid values: T6963C_ROM_MODE_OR, T6963C_ROM_MODE_XOR, T6963C_ROM_MODE_AND and T6963C_ROM_MODE_TEXT

Mode parameter explanation:

- **OR Mode**: In the OR-Mode, text and graphics can be displayed and the data is logically “OR-ed”. This is the most common way of combining text and graphics for example labels on buttons.
- **XOR-Mode**: In this mode, the text and graphics data are combined via the logical “exclusive OR”. This can be useful to display text in the negative mode, i.e. white text on black background.
- **AND-Mode**: The text and graphic data shown on display are combined via the logical “AND function”.
- **TEXT-Mode**: This option is only available when displaying just a text. The Text Attribute values are stored in the graphic area of display memory.

For more details see the T6963C datasheet.

**Requires**

Toshiba Glcd module needs to be initialized. See the T6963C_init routine.

**Example**

```c
T6963C_write_text(" Glcd LIBRARY DEMO, WELCOME !", 0, 0, T6963C_ROM_MODE_XOR);
```
### T6963C_line

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void T6963C_line(int x0, int y0, int x1, int y1, unsigned char pcolor);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Draws a line from (x0, y0) to (x1, y1).</td>
</tr>
<tr>
<td>Parameters:</td>
<td>- x0: x coordinate of the line start</td>
</tr>
<tr>
<td></td>
<td>- y0: y coordinate of the line end</td>
</tr>
<tr>
<td></td>
<td>- x1: x coordinate of the line start</td>
</tr>
<tr>
<td></td>
<td>- y1: y coordinate of the line end</td>
</tr>
<tr>
<td></td>
<td>- pcolor: color parameter. Valid values: T6963C_BLACK and T6963C_WHITE</td>
</tr>
<tr>
<td>Requires</td>
<td>Toshiba Glcd module needs to be initialized. See the T6963C_init routine.</td>
</tr>
<tr>
<td>Example</td>
<td><code>T6963C_line(0, 0, 239, 127, T6963C_WHITE);</code></td>
</tr>
</tbody>
</table>

### T6963C_rectangle

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void T6963C_rectangle(int x0, int y0, int x1, int y1, unsigned char pcolor);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Draws a rectangle on GLCD.</td>
</tr>
<tr>
<td>Parameters:</td>
<td>- x0: x coordinate of the upper left rectangle corner</td>
</tr>
<tr>
<td></td>
<td>- y0: y coordinate of the upper left rectangle corner</td>
</tr>
<tr>
<td></td>
<td>- x1: x coordinate of the lower right rectangle corner</td>
</tr>
<tr>
<td></td>
<td>- y1: y coordinate of the lower right rectangle corner</td>
</tr>
<tr>
<td></td>
<td>- pcolor: color parameter. Valid values: T6963C_BLACK and T6963C_WHITE</td>
</tr>
<tr>
<td>Requires</td>
<td>Toshiba Glcd module needs to be initialized. See the T6963C_init routine.</td>
</tr>
<tr>
<td>Example</td>
<td><code>T6963C_rectangle(20, 219, 107, T6963C_WHITE);</code></td>
</tr>
</tbody>
</table>
### T6963C_box

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void T6963C_box(int x0, int y0, int x1, int y1, unsigned char pcolor);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Draws a box on GLCD.</td>
</tr>
<tr>
<td>Parameters:</td>
<td>- <code>x0</code>: x coordinate of the upper left box corner</td>
</tr>
<tr>
<td></td>
<td>- <code>y0</code>: y coordinate of the upper left box corner</td>
</tr>
<tr>
<td></td>
<td>- <code>x1</code>: x coordinate of the lower right box corner</td>
</tr>
<tr>
<td></td>
<td>- <code>y1</code>: y coordinate of the lower right box corner</td>
</tr>
<tr>
<td></td>
<td>- <code>pcolor</code>: color parameter. Valid values: T6963C_BLACK and T6963C_WHITE</td>
</tr>
<tr>
<td>Requires</td>
<td>Toshiba Glcd module needs to be initialized. See the T6963C_init routine.</td>
</tr>
<tr>
<td>Example</td>
<td><code>T6963C_box(0, 119, 239, 127, T6963C_WHITE);</code></td>
</tr>
</tbody>
</table>

### T6963C_circle

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void T6963C_circle(int x, int y, long r, unsigned char pcolor);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Draws a circle on GLCD.</td>
</tr>
<tr>
<td>Parameters:</td>
<td>- <code>x</code>: x coordinate of the circle center</td>
</tr>
<tr>
<td></td>
<td>- <code>y</code>: y coordinate of the circle center</td>
</tr>
<tr>
<td></td>
<td>- <code>r</code>: radius size</td>
</tr>
<tr>
<td></td>
<td>- <code>pcolor</code>: color parameter. Valid values: T6963C_BLACK and T6963C_WHITE</td>
</tr>
<tr>
<td>Requires</td>
<td>Toshiba Glcd module needs to be initialized. See the T6963C_init routine.</td>
</tr>
<tr>
<td>Example</td>
<td><code>T6963C_circle(120, 64, 110, T6963C_WHITE);</code></td>
</tr>
</tbody>
</table>
## T6963C_image

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void T6963C_image(const code char *pic);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Displays bitmap on GLCD.</td>
</tr>
<tr>
<td>Description</td>
<td>Parameters:</td>
</tr>
<tr>
<td></td>
<td>- <em>pic</em>: image to be displayed. Bitmap array can be located in both code and RAM memory (due to the mikroC PRO for PIC pointer to const and pointer to RAM equivalency).</td>
</tr>
<tr>
<td></td>
<td>Use the mikroC PRO’s integrated Glcd Bitmap Editor (menu option <strong>Tools › Glcd Bitmap Editor</strong>) to convert image to a constant array suitable for displaying on Glcd.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: Image dimension must match the display dimension.</td>
</tr>
<tr>
<td>Requires</td>
<td>Toshiba Glcd module needs to be initialized. See the T6963C_init routine.</td>
</tr>
<tr>
<td>Example</td>
<td>T6963C_image(mc);</td>
</tr>
</tbody>
</table>

## T6963C_sprite

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void T6963C_sprite(unsigned char px, unsigned char py, const code char *pic, unsigned char sx, unsigned char sy);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Parameters:</td>
</tr>
<tr>
<td></td>
<td>- <em>px</em>: x coordinate of the upper left picture corner. Valid values: multiples of the font width</td>
</tr>
<tr>
<td></td>
<td>- <em>py</em>: y coordinate of the upper left picture corner</td>
</tr>
<tr>
<td></td>
<td>- <em>pic</em>: picture to be displayed</td>
</tr>
<tr>
<td></td>
<td>- <em>sx</em>: picture width. Valid values: multiples of the font width</td>
</tr>
<tr>
<td></td>
<td>- <em>sy</em>: picture height</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: If <em>px</em> and <em>sx</em> parameters are not multiples of the font width they will be scaled to the nearest lower number that is a multiple of the font width.</td>
</tr>
<tr>
<td>Requires</td>
<td>Toshiba Glcd module needs to be initialized. See the T6963C_init routine.</td>
</tr>
<tr>
<td>Example</td>
<td>T6963C_sprite(76, 4, einstein, 88, 119); // draw a sprite</td>
</tr>
</tbody>
</table>
### T6963C_set_cursor

**Prototype**

```c
void T6963C_set_cursor(unsigned char x, unsigned char y);
```

**Returns**

Nothing.

**Description**

Sets cursor to row x and column y.

**Parameters:**

- `x`: cursor position row number
- `y`: cursor position column number

**Requires**

Toshiba Glcd module needs to be initialized. See the T6963C_init routine.

**Example**

```c
T6963C_set_cursor(cposx, cposy);
```

### T6963C_clearBit

**Prototype**

```c
void T6963C_clearBit(char b);
```

**Returns**

Nothing.

**Description**

Clears control port bit(s).

**Parameters:**

- `b`: bit mask. The function will clear bit `x` on control port if bit `x` in bit mask is set to 1.

**Requires**

Toshiba Glcd module needs to be initialized. See the T6963C_init routine.

**Example**

```c
// clear bits 0 and 1 on control port
T6963C_clearBit(0x03);
```

### T6963C_setBit

**Prototype**

```c
void T6963C_setBit(char b);
```

**Returns**

Nothing.

**Description**

Sets control port bit(s).

**Parameters:**

- `b`: bit mask. The function will set bit `x` on control port if bit `x` in bit mask is set to 1.

**Requires**

Toshiba Glcd module needs to be initialized. See the T6963C_init routine.

**Example**

```c
// set bits 0 and 1 on control port
T6963C_setBit(0x03);
```
### T6963C_negBit

**Prototype**

```c
void T6963C_negBit(char b);
```

**Returns**

Nothing.

**Description**

Negates control port bit(s).

- **Parameters:**
  - `b`: bit mask. The function will negate bit `x` on control port if bit `x` in bit mask is set to 1.

**Requires**

Toshiba Glcd module needs to be initialized. See the T6963C_init routine.

**Example**

```c
// negate bits 0 and 1 on control port
T6963C_negBit(0x03);
```

### T6963C_displayGrPanel

**Prototype**

```c
void T6963C_displayGrPanel(char n);
```

**Returns**

Nothing.

**Description**

Display selected graphic panel.

- **Parameters:**
  - `n`: graphic panel number. Valid values: 0 and 1.

**Requires**

Toshiba Glcd module needs to be initialized. See the T6963C_init routine.

**Example**

```c
// display graphic panel 1
T6963C_displayGrPanel(1);
```

### T6963C_displayTxtPanel

**Prototype**

```c
void T6963C_displayTxtPanel(char n);
```

**Returns**

Nothing.

**Description**

Display selected text panel.

- **Parameters:**
  - `n`: text panel number. Valid values: 0 and 1.

**Requires**

Toshiba Glcd module needs to be initialized. See the T6963C_init routine.

**Example**

```c
// display text panel 1
T6963C_displayTxtPanel(1);
```
### T6963C_setGrPanel

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void T6963C_setTxtPanel(char n);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Compute start address for selected graphic panel and set appropriate internal pointers. All subsequent graphic operations will be performed at this graphic panel.</td>
</tr>
<tr>
<td>Parameters:</td>
<td>- <code>n</code>: graphic panel number. Valid values: 0 and 1.</td>
</tr>
<tr>
<td>Requires</td>
<td>Toshiba Glcd module needs to be initialized. See the T6963C_init routine.</td>
</tr>
<tr>
<td>Example</td>
<td>// set text panel 1 as current text panel. T6963C_setTxtPanel(1);</td>
</tr>
</tbody>
</table>

### T6963C_SetTxtPanel

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void T6963C_setTxtPanel(char n);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Compute start address for selected text panel and set appropriate internal pointers. All subsequent text operations will be performed at this text panel.</td>
</tr>
<tr>
<td>Parameters:</td>

<tr>
<th>Prototype</th>
<th><code>void T6963C_panelFill(unsigned char v);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Fill current panel in full (graphic+text) with appropriate value (0 to clear).</td>
</tr>
<tr>
<td>Parameters:</td>
<td>- <code>v</code>: value to fill panel with.</td>
</tr>
<tr>
<td>Requires</td>
<td>Toshiba Glcd module needs to be initialized. See the T6963C_init routine.</td>
</tr>
<tr>
<td>Example</td>
<td>//clear current panel T6963C_panelFill(0);</td>
</tr>
</tbody>
</table>
### T6963C_grFill

**Prototype**

```c
void T6963C_grFill(unsigned char v);
```

**Returns**

Nothing.

**Description**

Fill current graphic panel with appropriate value (0 to clear).

**Parameters:**

- `v`: value to fill graphic panel with.

**Requires**

Toshiba Glcd module needs to be initialized. See the T6963C_init routine.

**Example**

```c
// clear current graphic panel
T6963C_grFill(0);
```

### T6963C_txtFill

**Prototype**

```c
void T6963C_txtFill(unsigned char v);
```

**Returns**

Nothing.

**Description**

Fill current text panel with appropriate value (0 to clear).

**Parameters:**

- `v`: this value increased by 32 will be used to fill text panel.

**Requires**

Toshiba Glcd module needs to be initialized. See the T6963C_init routine.

**Example**

```c
// clear current text panel
T6963C_txtFill(0);
```

### T6963C_cursor_height

**Prototype**

```c
void T6963C_cursor_height(unsigned char n);
```

**Returns**

Nothing.

**Description**

Set cursor size.

**Parameters:**

- `n`: cursor height. Valid values: 0..7.

**Requires**

Toshiba Glcd module needs to be initialized. See the T6963C_init routine.

**Example**

```c
T6963C_cursor_height(7);
```
### T6963C_Graphics

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void T6963C_graphics(char n);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Enable/disable graphic displaying.</td>
</tr>
<tr>
<td></td>
<td>Parameters:</td>
</tr>
<tr>
<td></td>
<td>- <code>n</code>: on/off parameter. Valid values: 0 (disable graphic displaying) and 1 (enable graphic displaying).</td>
</tr>
<tr>
<td>Requires</td>
<td>Toshiba Glcd module needs to be initialized. See the T6963C_init routine.</td>
</tr>
<tr>
<td>Example</td>
<td><code>// enable graphic displaying</code></td>
</tr>
<tr>
<td></td>
<td><code>T6963C_graphics(1);</code></td>
</tr>
</tbody>
</table>

### T6963C_text

<table>
<thead>

<td>Set cursor on/off.</td>
</tr>
<tr>
<td></td>
<td>Parameters:</td>
</tr>
<tr>
<td></td>
<td>- <code>n</code>: on/off parameter. Valid values: 0 (set cursor off) and 1 (set cursor on).</td>
</tr>
<tr>
<td>Requires</td>
<td>Toshiba Glcd module needs to be initialized. See the T6963C_init routine.</td>
</tr>
<tr>
<td>Example</td>
<td><code>// set cursor on</code></td>
</tr>
<tr>
<td></td>
<td><code>T6963C_cursor(1);</code></td>
</tr>
</tbody>
</table>
**T6963C_Cursor_Blink**

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void T6963C_cursor_blink(char n);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Enable/disable cursor blinking.</td>
</tr>
<tr>
<td>Parameters:</td>
<td></td>
</tr>
<tr>
<td>- n: on/off parameter. Valid values: 0 (disable cursor blinking) and 1 (enable cursor blinking).</td>
<td></td>
</tr>
<tr>
<td>Requires</td>
<td>Toshiba Glcd module needs to be initialized. See the T6963C_init routine.</td>
</tr>
<tr>
<td>Example</td>
<td>// enable cursor blinking</td>
</tr>
<tr>
<td></td>
<td>T6963C_cursor_blink(1);</td>
</tr>
</tbody>
</table>

**Library Example**

The following drawing demo tests advanced routines of the T6963C Glcd library. Hardware configurations in this example are made for the T6963C 240x128 display, EasyPIC5 board and 16F887.

```c
#include "__T6963C.h"

// T6963C module connections
char T6963C_dataPort at PORTD; // DATA port
sbit T6963C_ctrlwr at RC2_bit;  // WR write signal
sbit T6963C_ctrlrd at RC1_bit;  // RD read signal
sbit T6963C_ctrlcd at RC0_bit;  // CD command/data signal
sbit T6963C_ctrlrst at RC4_bit; // RST reset signal
sbit T6963C_ctrlwr_Direction at TRISC2_bit; // WR write signal
sbit T6963C_ctrlrd_Direction at TRISC1_bit; // RD read signal
sbit T6963C_ctrlcd_Direction at TRISC0_bit; // CD command/data signal
sbit T6963C_ctrlrst_Direction at TRISC4_bit; // RST reset signal

// Signals not used by library, they are set in main function
sbit T6963C_ctrlce at RC3_bit;  // CE signal
sbit T6963C_ctrlfs at RC6_bit;  // FS signal
sbit T6963C_ctrlmd at RC5_bit;  // MD signal
sbit T6963C_ctrlce_Direction at TRISC3_bit; // CE signal direction
sbit T6963C_ctrlfs_Direction at TRISC6_bit; // FS signal direction
sbit T6963C_ctrlmd_Direction at TRISC5_bit; // MD signal direction

// End T6963C module connections

HW Connection

Toshiba T6963C Graphic LCD (240x128)

T6963C GLCD HW connection
**UART LIBRARY**

UART hardware module is available with a number of PIC MCUs. mikroC PRO for PIC UART Library provides comfortable work with the Asynchronous (full duplex) mode.

You can easily communicate with other devices via RS-232 protocol (for example with PC, see the figure at the end of the topic – RS-232 HW connection). You need a PIC MCU with hardware integrated UART, for example 16F887. Then, simply use the functions listed below.

**Note**: Some PIC18 MCUs have multiple UART modules. Switching between the UART modules in the UART library is done by the UART_Set_Active function (UART module has to be previously initialized).

**Note**: In order to use the desired UART library routine, simply change the number 1 in the prototype with the appropriate module number, i.e. `UART2_Init(2400);`

**Library Routines**

- UART1_Init
- UART1_Data_Ready
- UART1_Tx_Idle
- UART1_Read
- UART1_Read_Text
- UART1_Write
- UART1_Write_Text
- UART_Set_Active
### Uart_Init

<table>
<thead>
<tr>
<th>Prototype</th>
<th>\texttt{void UART1_Init(unsigned long baud_rate);}</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Initializes desired hardware UART module with the desired baud rate. Refer to the device data sheet for baud rates allowed for specific \texttt{Fosc}. If you specify the unsupported baud rate, compiler will report an error.</td>
</tr>
<tr>
<td>Requires</td>
<td>You need PIC MCU with hardware UART. \par \texttt{UART1_Init} needs to be called before using other functions from UART Library. \par Parameters: \par \texttt{- baud_rate} requested baud rate \par Refer to the device data sheet for baud rates allowed for specific \texttt{Fosc}. \textbf{Note}: Calculation of the UART baud rate value is carried out by the compiler, as it would produce a relatively large code if performed on the library level. Therefore, compiler needs to know the value of the parameter in the compile time. That is why this parameter needs to be a constant, and not a variable.</td>
</tr>
<tr>
<td>Example</td>
<td>This will initialize hardware UART1 module and establish the communication at 2400 bps: \par \texttt{UART1_Init(2400);}</td>
</tr>
</tbody>
</table>
### Uart_Data_Ready

**Prototype**

```c
char UART1_Data_Ready();
```

**Returns**

- 1 if data is ready for reading
- 0 if there is no data in the receive register

**Description**
Use the function to test if data in receive buffer is ready for reading.

**Requires**
UART HW module must be initialized and communication established before using this function. See UART1_Init.

**Example**

```c
// If data is ready, read it:
if (UART1_Data_Ready() == 1) {
    receive = UART1_Read();
}
```

### UART1_Tx_Idle

**Prototype**

```c
char UART1_Tx_Idle();
```

**Returns**

- 1 if data is ready for reading
- 0 if there is no data in the receive register

**Description**
Use the function to test if the transmit shift register is empty or not.

**Requires**
UART HW module must be initialized and communication established before using this function. See UART1_Init.

**Example**

```c
// If the previous data has been shifted out, send next data:
if (UART1_Tx_Idle() == 1) {
    UART1_Write(_data);
}
```

### UART1_Read

**Prototype**

```c
char UART1_Read();
```

**Returns**
Returns the received byte.

**Description**
Function receives a byte via UART. Use the function UART1_Data_Ready to test if data is ready first.

**Requires**
UART HW module must be initialized and communication established before using this function. See UART1_Init.

**Example**

```c
// If data is ready, read it:
if (UART1_Data_Ready() == 1) {
    receive = UART1_Read();
}
```
UART1_Read_Text

Prototype  
```c
void UART1_Read_Text(char *Output, char *Delimiter, char Attempts);
```

Returns  
Nothing.

Description  
Reads characters received via UART until the delimiter sequence is detected. The read sequence is stored in the parameter `output`; delimiter sequence is stored in the parameter `delimiter`.

This is a blocking call: the delimiter sequence is expected, otherwise the procedure exits (if the delimiter is not found). Parameter `Attempts` defines number of received characters in which `Delimiter` sequence is expected. If `Attempts` is set to 255, this routine will continuously try to detect the `Delimiter` sequence.

Requires  
UART HW module must be initialized and communication established before using this function. See UART1_Init.

Example  
```c
Read text until the sequence “OK” is received, and send back what’s been received:

UART1_Init(4800);     // initialize UART1 module
Delay_ms(100);

while (1) {
    if (UART1_Data_Ready() == 1) {  // if data is received
        UART1_Read_Text(output, "delim", 10); // reads text until 'delim' is found
        UART1_Write_Text(output); // sends back text
    }
}
```

UART1_Write

Prototype  
```c
void UART1_Write(char _data);
```

Returns  
Nothing.

Description  
The function transmits a byte via the UART module.

Parameters:
- `_data`: data to be sent

Requires  
UART HW module must be initialized and communication established before using this function. See UART1_Init.

Example  
```c
unsigned char _data = 0x1E;
...
UART1_Write(_data);
```
**UART1_Write_Text**

</tr>
</tbody>
</table>
Library Example

The example demonstrates a simple data exchange via UART. When PIC MCU receives data, it immediately sends it back. If PIC is connected to the PC (see the figure below), you can test the example from the *mikroC PRO for PIC* terminal for RS-232 communication, menu choice **Tools › Terminal**.

```c
char uart_rd;

void main() {
    UART1_Init(9600); // Initialize UART module at 9600 bps
    Delay_ms(100); // Wait for UART module to stabilize

    while (1) { // Endless loop
        if (UART1_Data_Ready()) { // If data is received,
            uart_rd = UART1_Read(); //   read the received data,
            UART1_Write(uart_rd); //   and send data via UART
        }
    }
}
```
RS-232 HW connection
USB HID LIBRARY

Universal Serial Bus (USB) provides a serial bus standard for connecting a wide variety of devices, including computers, cell phones, game consoles, PDA’s, etc.

*mikroC PRO for PIC* includes a library for working with human interface devices via Universal Serial Bus. A human interface device or HID is a type of computer device that interacts directly with and takes input from humans, such as the keyboard, mouse, graphics tablet, and the like.

Descriptor File

Each project based on the USB HID library should include a descriptor source file which contains vendor id and name, product id and name, report length, and other relevant information. To create a descriptor file, use the integrated USB HID terminal of mikroC PRO for PIC (Tools › USB HID Terminal). The default name for descriptor file is *USBdsc.c*, but you may rename it.

The provided code in the “Examples” folder works at 48MHz, and the flags should not be modified without consulting the appropriate datasheet first.

Library Routines

- Hid_Enable
- Hid_Read
- Hid_Write
- Hid_Disable
Hid_Enable

Prototype

void Hid_Enable(unsigned readbuff, unsigned writebuff);

Returns

Nothing.

Description

Enables USB HID communication. Parameters readbuff and writebuff are the Read Buffer and the Write Buffer, respectively, which are used for HID communication.

This function needs to be called before using other routines of USB HID Library.

Requires

Nothing.

Example

Hid_Enable(&rd, &wr);

Hid_Read

Prototype

unsigned char Hid_Read(void);

Returns

Number of characters in the Read Buffer received from the host.

Description

Receives message from host and stores it in the Read Buffer. Function returns the number of characters received in the Read Buffer.

Requires

USB HID needs to be enabled before using this function. See Hid_Enable.

Example

get = Hid_Read();

Hid_Write

Prototype

unsigned short Hid_Write(unsigned writebuff, unsigned short len);

Returns

1 if data was successfully sent, 0 if not.

Description

Function sends data from Write Buffer writebuff to host. Write Buffer is the same parameter as used in initialization; see Hid_Enable. Parameter len should specify a length of the data to be transmitted.

Function call needs to be repeated as long as data is not successfully sent.

Requires

USB HID needs to be enabled before using this function. See Hid_Enable.

Example

// retry until success.
while(!Hid_Write(&my_Usb_Buff, 1));
The following example continually sends sequence of numbers 0..255 to the PC via Universal Serial Bus. `usbdsc.c` must be included in the project (via mikroC PRO for PIC IDE tool or via `#include` mechanism in source code).

```c
unsigned short m, k;
unsigned short userRD_buffer[64];
unsigned short userWR_buffer[64];

void interrupt() {
    asm CALL _Hid_InterruptProc
    asm nop
}

void Init_Main() {
    // Disable all interrupts
    // Disable GIE, PEIE, TMR0IE, INT0IE, RBIE
    INTCON = 0;
    INTCON2 = 0xF5;
    INTCON3 = 0xC0;
    // Disable Priority Levels on interrupts
    RCON.IPEN = 0;
    PIE1 = 0;
    PIE2 = 0;
    PIR1 = 0;
    PIR2 = 0;

    // Configure all ports with analog function as digital
    ADCON1 |= 0x0F;

    // Ports Configuration
    TRISA = 0;
    TRISB = 0;
    TRISC = 0xFF;
    TRISD = 0xFF;
    TRISE = 0x07;
}
```

</tr>
<tr>
<td>Example</td>
<td><code>Hid_Disable();</code></td>
</tr>
</tbody>
</table>

**Prototype**

- `void Hid_Disable(void);`

**Returns**

- Nothing.

**Description**

- Disables USB HID communication.

**Requires**

- USB HID needs to be enabled before using this function. See Hid_Enable.

**Example**

- `Hid_Disable();`
LATA = 0;
LATB = 0;
LATC = 0;
LATD = 0;
LATE = 0;

// Clear user RAM
// Banks [00 .. 07] (8 x 256 = 2048 Bytes)
asm {
    LFSR        FSR0, 0x000
    MOVLW      0x08
    CLRF        POSTINC0, 0
    CPFSEQ      FSR0H, 0
    BRA $ - 2
}

// Timer 0

STANDARD ANSI C LIBRARIES

- ANSI C Ctype Library
- ANSI C Math Library
- ANSI C Stdlib Library
- ANSI C String Library

ANSI C Ctype Library

The mikroC PRO for PIC provides a set of standard ANSI C library functions for testing and mapping characters.

Note: Not all of the standard functions have been included.

Note: The functions have been mostly implemented according to the ANSI C standard, but certain functions have been modified in order to facilitate PIC programming. Be sure to skim through the description before using standard C functions.

Library Functions

- isalnum
- isalpha
- iscntrl
- isdigit
- isgraph
- islower
- ispunct
- isspace
- isupper
- isxdigit
- toupper
- tolower
### isalnum

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned short isalpha(char character);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Function returns 1 if the <code>character</code> is alphanumeric (A-Z, a-z, 0-9), otherwise returns zero.</td>
</tr>
</tbody>
</table>

### isalpha

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned short isalpha(char character);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Function returns 1 if the <code>character</code> is alphabetic (A-Z, a-z), otherwise returns zero.</td>
</tr>

</table>

### iscntrl

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned short iscntrl(char character);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Function returns 1 if the <code>character</code> is a control or delete character(decimal 0-31 and 127), otherwise returns zero.</td>
</tr>
</tbody>
</table>

### isdigit

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned short isdigit(char character);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Function returns 1 if the <code>character</code> is a digit (0-9), otherwise returns zero.</td>
</tr>
</tbody>
</table>

### isgraph

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned short isgraph(char character);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Function returns 1 if the <code>character</code> is a printable, excluding the space (decimal 32), otherwise returns zero.</td>
</tr>
</tbody>
</table>

### islower

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>int islower(char character);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Function returns 1 if the <code>character</code> is a lowercase letter (a-z), otherwise returns zero.</td>
</tr>
</tbody>
</table>

### ispunct

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned short ispunct(char character);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Function returns 1 if the <code>character</code> is a punctuation (decimal 32-47, 58-63, 91-96, 123-126), otherwise returns zero.</td>
</tr>
</tbody>
</table>
### isspace

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned short isspace(char character);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Function returns 1 if the <em>character</em> is a white space (space, tab, CR, HT, VT, NL, FF), otherwise returns zero.</td>
</tr>
</tbody>
</table>

### isupper

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned short isupper(char character);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Function returns 1 if the <em>character</em> is an uppercase letter (A-Z), otherwise returns zero.</td>
</tr>
</tbody>
</table>

### isxdigit

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned short isxdigit(char character);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Function returns 1 if the <em>character</em> is a hex digit (0-9, A-F, a-f), otherwise returns zero.</td>
</tr>
</tbody>
</table>

### toupper

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned short toupper(char character);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>If the <em>character</em> is a lowercase letter (a-z), the function returns an uppercase letter. Otherwise, the function returns an unchanged input parameter.</td>
</tr>
</tbody>
</table>

### tolower

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned short tolower(char character);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>If the <em>character</em> is an uppercase letter (A-Z), function returns a lowercase letter. Otherwise, function returns an unchanged input parameter.</td>
</tr>
</tbody>
</table>
ANSI C Math Library

The mikroC PRO for PIC provides a set of standard ANSI C library functions for floating point math handling.

Note: Not all of the standard functions have been included.

Note: The functions have been mostly implemented according to the ANSI C standard, but certain functions have been modified in order to facilitate PIC programming. Be sure to skim through the description before using standard C functions.

Library Functions

- acos
- asin
- atan
- atan2
- ceil
- cos
- cosh
- eval_poly
- exp
- fabs
- floor
- frexp
- ldexp
- log
- log10
- modf
- pow
- sin
- sinh
- sqrt
- tan
- tanh
### acos

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>double acos(double x);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Function returns the arc cosine of parameter ( x ); that is, the value whose cosine is ( x ). The input parameter ( x ) must be between -1 and 1 (inclusive). The return value is in radians, between 0 and ( \pi ) (inclusive).</td>
</tr>
</tbody>
</table>

### asin

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>double asin(double x);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Function returns the arc sine of parameter ( x ); that is, the value whose sine is ( x ). The input parameter ( x ) must be between -1 and 1 (inclusive). The return value is in radians, between -( \pi/2 ) and ( \pi/2 ) (inclusive).</td>
</tr>
</tbody>
</table>

### atan

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>double atan(double f);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Function computes the arc tangent of parameter ( f ); that is, the value whose tangent is ( f ). The return value is in radians, between -( \pi/2 ) and ( \pi/2 ) (inclusive).</td>
</tr>
</tbody>
</table>

### atan2

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>double atan2(double y, double x);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>This is the two-argument arc tangent function. It is similar to computing the arc tangent of ( y/x ), except that the signs of both arguments are used to determine the quadrant of the result and ( x ) is permitted to be zero. The return value is in radians, between -( \pi ) and ( \pi ) (inclusive).</td>
</tr>
</tbody>
</table>

### ceil

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>double ceil(double x);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Function returns value of parameter ( x ) rounded up to the next whole number.</td>
</tr>
</tbody>
</table>

### cos

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>double cos(double f);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Function returns the cosine of ( f ) in radians. The return value is from -1 to 1.</td>
</tr>
</tbody>
</table>
### cosh

**Prototype**
```c
double cosh(double x);
```

**Description**
Function returns the hyperbolic cosine of \( x \), defined mathematically as \( \frac{e^x + e^{-x}}{2} \). If the value of \( x \) is too large (if overflow occurs), the function fails.

### eval_poly

**Prototype**
```c
static double eval_poly(double x, const double code * d, int n);
```

**Description**
Function calculates the polynomial for number \( x \), with coefficients stored in \( d[] \), for degree \( n \).

### exp

**Prototype**
```c
double exp(double x);
```

**Description**
Function returns the value of \( e \) — the base of natural logarithms — raised to the power \( x \) (i.e. \( e^x \)).

### fabs

**Prototype**
```c
double fabs(double d);
```

**Description**
Function returns the absolute (i.e. positive) value of \( d \).

### floor

**Prototype**
```c
double floor(double x);
```

**Description**
Function returns the value of parameter \( x \) rounded down to the nearest integer.

### frexp

**Prototype**
```c
double frexp(double value, int *eptr);
```

**Description**
Function splits a floating-point value into a normalized fraction and an integral power of 2. The return value is the normalized fraction and the integer exponent is stored in the object pointed to by \( eptr \).

### ldexp

**Prototype**
```c
double ldexp(double value, int newexp);
```

**Description**
Function returns the result of multiplying the floating-point number \( num \) by 2 raised to the power \( n \) (i.e. returns \( x \times 2^n \)).
### log
```
Prototype: double log(double x);
Description: Function returns the natural logarithm of x (i.e. \( \log_e(x) \)).
```

### log10
```
Prototype: double log10(double x);
Description: Function returns the base-10 logarithm of x (i.e. \( \log_{10}(x) \)).
```

### modf
```
Prototype: double modf(double val, double * iptr);
Description: Returns argument val split to the fractional part (function return val) and integer part (in number iptr).
```

### pow
```
Prototype: double pow(double x, double y);
Description: Function returns the value of \( x \) raised to the power \( y \) (i.e. \( x^y \)). If \( x \) is negative, the function will automatically cast \( y \) into unsigned long.
```

### sin
```
Prototype: double sin(double f);
Description: Function returns the sine of \( f \) in radians. The return value is from -1 to 1.
```

### sinh
```
Prototype: double sinh(double x);
Description: Function returns the hyperbolic sine of \( x \), defined mathematically as \( \frac{e^x - e^{-x}}{2} \). If the value of \( x \) is too large (if overflow occurs), the function fails.
```

### sqrt
```
Prototype: double sqrt(double x);
Description: Function returns the non negative square root of \( x \).
```
### tan

<table>
<thead>
<tr>
<th>Prototype</th>
<th>double tan(double x);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Function returns the tangent of ( x ) in radians. The return value spans the allowed range of floating point in the <em>mikroC PRO for PIC</em>.</td>
</tr>
</tbody>
</table>

### tanh

<table>
<thead>
<tr>
<th>Prototype</th>
<th>double tanh(double x);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Function returns the hyperbolic tangent of ( x ), defined mathematically as ( \frac{\sinh(x)}{\cosh(x)} ).</td>
</tr>
</tbody>
</table>

### ANSI C Stdlib Library

The *mikroC PRO for PIC* provides a set of standard ANSI C library functions of general utility.

**Note:** Not all of the standard functions have been included.

**Note:** Functions have been mostly implemented according to the ANSI C standard, but certain functions have been modified in order to facilitate PIC programming. Be sure to skim through the description before using standard C functions.

### Library Functions

- abs
- atof
- atoi
- atol
- div
- lddiv
- uldiv
- labs
- max
- min
- rand
- srand
- xtoi
### abs

**Prototype**

```c
int abs(int a);
```

**Description**

Function returns the absolute (i.e. positive) value of \( a \).

### atof

**Prototype**

```c
double atof(char *s)
```

**Description**

Function converts the input string \( s \) into a double precision value and returns the value. Input string \( s \) should conform to the floating point literal format, with an optional whitespace at the beginning. The string will be processed one character at a time, until the function reaches a character which it doesn’t recognize (including a null character).

### atoi

**Prototype**

```c
int atoi(char *s);
```

**Description**

Function converts the input string \( s \) into an integer value and returns the value. The input string \( s \) should consist exclusively of decimal digits, with an optional whitespace and a sign at the beginning. The string will be processed one character at a time, until the function reaches a character which it doesn’t recognize (including a null character).

### atol

**Prototype**

```c
long atol(char *s)
```

**Description**

Function converts the input string \( s \) into a long integer value and returns the value. The input string \( s \) should consist exclusively of decimal digits, with an optional whitespace and a sign at the beginning. The string will be processed one character at a time, until the function reaches a character which it doesn’t recognize (including a null character).

### div

**Prototype**

```c
div_t div(int number, int denom);
```

**Description**

Function computes the result of division of the numerator \( \text{number} \) by the denominator \( \text{denom} \); the function returns a structure of type \( \text{div_t} \) comprising quotient (\( \text{quot} \)) and remainder (\( \text{rem} \)), see Div Structures.
### ldiv

**Prototype**
```c
ldiv_t ldiv(long number, long denom);
```

**Description**
Function is similar to the div function, except that the arguments and result structure members all have type `long`.

Function computes the result of division of the numerator `number` by the denominator `denom`; the function returns a structure of type `ldiv_t` comprising quotient (`quot`) and remainder (`rem`), see Div Structures.

### uldiv

**Prototype**
```c
uldiv_t uldiv(unsigned long number, unsigned long denom);
```

**Description**
Function is similar to the div function, except that the arguments and result structure members all have type `unsigned long`.

Function computes the result of division of the numerator `number` by the denominator `denom`; the function returns a structure of type `uldiv_t` comprising quotient (`quot`) and remainder (`rem`), see Div Structures.

### labs

**Prototype**
```c
long labs(long x);
```

**Description**
Function returns the absolute (i.e. positive) value of long integer `x`.

### max

**Prototype**
```c
int max(int a, int b);
```

**Description**
Function returns greater of the two integers, `a` and `b`.

### min

**Prototype**
```c
int min(int a, int b);
```

**Description**
Function returns lower of the two integers, `a` and `b`.

### rand

**Prototype**
```c
int rand();
```

**Description**
Function returns a sequence of pseudo-random numbers between 0 and 32767. The function will always produce the same sequence of numbers unless srand is called to seed the start point.
### srand

**Prototype**

<table>
<thead>
<tr>
<th>C Code</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>void srand(unsigned x);</code></td>
</tr>
</tbody>
</table>

**Description**

Function uses `x` as a starting point for a new sequence of pseudo-random numbers to be returned by subsequent calls to `rand`. No values are returned by this function.

### xtoi

**Prototype**

<table>
<thead>
<tr>
<th>C Code</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>unsigned xtoi(register char *s);</code></td>
</tr>
</tbody>
</table>

**Description**

Function converts the input string `s` consisting of hexadecimal digits into an integer value. The input parameter `s` should consist exclusively of hexadecimal digits, with an optional whitespace and a sign at the beginning. The string will be processed one character at a time, until the function reaches a character which it doesn’t recognize (including a null character).

### Div Structures

```c
typedef struct divstruct {
    int quot;
    int rem;
} div_t;

typedef struct ldivstruct {
    long quot;
    long rem;
} ldiv_t;

typedef struct uldivstruct {
    unsigned long quot;
    unsigned long rem;
} uldiv_t;
```
ANSI C String Library

The mikroC PRO for PIC provides a set of standard ANSI C library functions useful for manipulating strings and RAM memory.

**Note**: Not all of the standard functions have been included.

**Note**: Functions have been mostly implemented according to the ANSI C standard, but certain functions have been modified in order to facilitate PIC programming. Be sure to skim through the description before using standard C functions.

Library Functions

- memchr
- memcmp
- memcpy
- memmove
- memset
- strcat
- strchr
- strcmp
- strcpy
- strlen
- strncat
- strncpy
- strspn
- strncmp
- strstr
- strcspn
- strpbrk
- strrchr
### memchr

**Prototype**

```c
void *memchr(void *p, char n, unsigned int v);
```

**Description**

Function locates the first occurrence of `n` in the initial `v` bytes of memory area starting at the address `p`. The function returns the pointer to this location or 0 if the `n` was not found. For parameter `p` you can use either a numerical value (literal/variable/constant) indicating memory address or a dereferenced value of an object, for example `&mystring` or `&P0`.

### memcmp

**Prototype**

```c
int memcmp(void *s1, void *s2, int n);
```

**Description**

Function compares the first `n` characters of objects pointed to by `s1` and `s2` and returns zero if the objects are equal, or returns a difference between the first differing characters (in a left-to-right evaluation). Accordingly, the result is greater than zero if the object pointed to by `s1` is greater than the object pointed to by `s2` and vice versa.

### memcpy

**Prototype**

```c
void *memcpy(void *d1, void *s1, int n);
```

**Description**

Function copies `n` characters from the object pointed to by `s1` into the object pointed to by `d1`. If copying takes place between objects that overlap, the behavior is undefined. The function returns address of the object pointed to by `d1`.

### memmove

**Prototype**

```c
void *memmove(void *to, void *from, register int n);
```

**Description**

Function copies `n` characters from the object pointed to by `from` into the object pointed to by `to`. Unlike memcpy, the memory areas `to` and `from` may overlap. The function returns address of the object pointed to by `to`.

### memset

**Prototype**

```c
void *memset(void *p1, char character, int n);
```

**Description**

Function copies the value of the `character` into each of the first `n` characters of the object pointed by `p1`. The function returns address of the object pointed to by `p1`. 
### strcat

**Prototype**

```c
char *strcat(char *to, char *from);
```

**Description**

Function appends a copy of the string `from` to the string `to`, overwriting the null character at the end of `to`. Then, a terminating null character is added to the result. If copying takes place between objects that overlap, the behavior is undefined. `to` string must have enough space to store the result. The function returns address of the object pointed to by `to`.

### strchr

**Prototype**

```c
char *strchr(char *ptr, char chr);
```

**Description**

Function locates the first occurrence of character `chr` in the string `ptr`. The function returns a pointer to the first occurrence of character `chr`, or a null pointer if `chr` does not occur in `ptr`. The terminating null character is considered to be a part of the string.

### strcmp

**Prototype**

```c
int strcmp(char *s1, char *s2);
```

**Description**

Function compares strings `s1` and `s2` and returns zero if the strings are equal, or returns a difference between the first differing characters (in a left-to-right evaluation). Accordingly, the result is greater than zero if `s1` is greater than `s2` and vice versa.

### strcpy

**Prototype**

```c
char *strcpy(char *to, char *from);
```

**Description**

Function copies the string `from` into the string `to`. If copying is successful, the function returns `to`. If copying takes place between objects that overlap, the behavior is undefined.

### strlen

**Prototype**

```c
int strlen(char *s);
```

**Description**

Function returns the length of the string `s` (the terminating null character does not count against string’s length).
### strncat

<table>
<thead>
<tr>
<th>Prototype</th>
<th>char *strncat(char *to, char *from, int size);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Function appends not more than size characters from the string from to to. The initial character of from overwrites the null character at the end of to. The terminating null character is always appended to the result. The function returns to.</td>
</tr>
</tbody>
</table>

### strncpy

<table>
<thead>
<tr>
<th>Prototype</th>
<th>char *strncpy(char *to, char *from, int size);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Function copies not more than size characters from string from to to. If copying takes place between objects that overlap, the behavior is undefined. If from is shorter than size characters, then to will be padded out with null characters to make up the difference. The function returns the resulting string to.</td>
</tr>
</tbody>
</table>

### strspn

<table>
<thead>
<tr>
<th>Prototype</th>
<th>int strspn(char *str1, char *str2);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Function returns the length of the maximum initial segment of str1 which consists entirely of characters from str2. The terminating null character at the end of the string is not compared.</td>
</tr>
</tbody>
</table>

### strncmp

<table>
<thead>
<tr>
<th>Prototype</th>
<th>int strncmp(char *s1, char *s2, char len);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Function lexicographically compares not more than len characters (characters that follow the null character are not compared) from the string pointed by s1 to the string pointed by s2. The function returns a value indicating the s1 and s2 relationship:</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt; 0</td>
<td>s1 &quot;less than&quot; s2</td>
</tr>
<tr>
<td>= 0</td>
<td>s1 &quot;equal to&quot; s2</td>
</tr>
<tr>
<td>&gt; 0</td>
<td>s1 &quot;greater than&quot; s2</td>
</tr>
</tbody>
</table>
### strstr

**Prototype**

```c
char *strstr(char *s1, char *s2);
```

**Description**

Function locates the first occurrence of the string `s2` in the string `s1` (excluding the terminating null character).

The function returns pointer to first occurrence of `s2` in `s1`; if no string was found, function returns 0. If `s2` is a null string, the function returns 0.

### strcspn

**Prototype**

```c
char *strcspn(char * s1, char *s2);
```

**Description**

Function computes the length of the maximum initial segment of the string pointed to by `s1` that consists entirely of characters that are not in the string pointed to by `s2`.

The function returns the length of the initial segment.

### strpbrk

**Prototype**

```c
char *strpbrk(char * s1, char *s2);
```

**Description**

Function searches `s1` for the first occurrence of any character from the string `s2`. The terminating null character is not included in the search. The function returns pointer to the matching character in `s1`. If `s1` contains no characters from `s2`, the function returns 0.

### strrchr

**Prototype**

```c
char *strrchr(char * ptr, unsigned int chr);
```

**Description**

Function searches the string `ptr` for the last occurrence of character `chr`. The null character terminating `ptr` is not included in the search. The function returns pointer to the last `chr` found in `ptr`; if no matching character was found, function returns 0.
MISCELLANEOUS LIBRARIES

- Button Library
- Conversions Library
- Sprint Library
- Setjmp Library
- Time Library
- Trigonometry Library
# BUTTON LIBRARY

The Button library contains miscellaneous routines useful for a project development.

## Library Routines

- Button

## Button

### Prototype

```c
unsigned short Button(unsigned short *port, unsigned short pin,
unsigned short time, unsigned short active_state);
```

### Returns

Returns 0 or 255.

### Description

Function eliminates the influence of contact flickering upon pressing a button (debouncing).

Parameter `port` specifies the location of the button; parameter `pin` is the pin number on designated `port` and goes from 0..7; parameter `time` is a debounce period in milliseconds; parameter `active_state` can be either 0 or 1, and it determines if the button is active upon logical zero or logical one.

### Requires

Button pin must be configured as input.

### Example

Example reads RB0, to which the button is connected; on transition from 1 to 0 (release of button), PORTD is inverted:

```c
do {
    if (Button(&PORTB, 0, 1, 1)) oldstate = 1;
    if (oldstate & Button(&PORTB, 0, 1, 0)) {
        PORTD = ~PORTD;
        oldstate = 0;
    }
} while(1);
```
CONVERSIONS LIBRARY

The mikroC PRO for PIC Conversions Library provides routines for numerals to strings and BCD/decimal conversions.

Library Routines

You can get text representation of numerical value by passing it to one of the following routines:

- ByteToStr
- ShortToStr
- WordToStr
- IntToStr
- LongToStr
- LongWordToStr
- FloatToStr

The following functions convert decimal values to BCD and vice versa:

- Dec2Bcd
- Bcd2Dec16
- Dec2Bcd16
### ByteToStr

**Prototype**
```c
void ByteToStr(unsigned short input, char *output);
```

**Returns**
Nothing.

**Description**
Converts input byte to a string. The output string has fixed width of 4 characters including null character at the end (string termination). The output string is right justified and remaining positions on the left (if any) are filled with blanks.

**Parameters:**
- `input`: byte to be converted
- `output`: destination string

**Requires**
Destination string should be at least 4 characters in length.

**Example**
```c
unsigned short t = 24;
char txt[4];
...
ByteToStr(t, txt);  // txt is " 24" (one blank here)
```

### ShortToStr

**Prototype**
```c
void ShortToStr(short input, char *output);
```

**Returns**
Nothing.

**Description**
Converts input signed short number to a string. The output string has fixed width of 5 characters including null character at the end (string termination). The output string is right justified and remaining positions on the left (if any) are filled with blanks.

**Parameters:**
- `input`: short number to be converted
- `output`: destination string

**Requires**
Destination string should be at least 5 characters in length.

**Example**
```c
short t = -24;
char txt[5];
...
ShortToStr(t, txt);  // txt is " -24" (one blank here)
### WordToStr

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void WordToStr(unsigned input, char *output);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Converts input word to a string. The output string has fixed width of 6 characters including null character at the end (string termination). The output string is right justified and the remaining positions on the left (if any) are filled with blanks.</td>
</tr>
</tbody>
</table>
| Parameters:   | - input: word to be converted  
- output: destination string |
| Requires      | Destination string should be at least 6 characters in length. |
| Example       | unsigned t = 437;  
char txt[6];  
...  
WordToStr(t, txt);  // txt is "  437" (two blanks here) |

### IntToStr

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void IntToStr(int input, char *output);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Converts input signed integer number to a string. The output string has fixed width of 7 characters including null character at the end (string termination). The output string is right justified and the remaining positions on the left (if any) are filled with blanks.</td>
</tr>
</tbody>
</table>
| Parameters:   | - input: signed integer number to be converted  
- output: destination string |
| Requires      | Destination string should be at least 7 characters in length. |
| Example       | int j = -4220;  
char txt[7];  
...  
IntToStr(j, txt);  // txt is " -4220" (one blank here) |
### LongintToStr

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void LongToStr(long input, char *output);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Converts input signed long integer number to a string. The output string has fixed width of 12 characters including null character at the end (string termination). The output string is right justified and the remaining positions on the left (if any) are filled with blanks.</td>
</tr>
</tbody>
</table>
| Parameters      | - input: signed long integer number to be converted  
|                 | - output: destination string |
| Requires        | Destination string should be at least 12 characters in length. |
| Example         | long jj = -3700000;  
|                 | char txt[12];  
|                 | ...  
|                 | LongToStr(jj, txt);  
|                 | // txt is "   -3700000" (three blanks here) |

### LongWordToStr

<table>
<thead>
<tr>
<th>Prototype</th>
<th>void LongWordToStr(unsigned long input, char *output);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Description</td>
<td>Converts input unsigned long integer number to a string. The output string has fixed width of 11 characters including null character at the end (string termination). The output string is right justified and the remaining positions on the left (if any) are filled with blanks.</td>
</tr>
</tbody>
</table>
| Parameters      | - input: unsigned long integer number to be converted  
|                 | - output: destination string |
| Requires        | Destination string should be at least 11 characters in length. |
| Example         | unsigned long jj = 3700000;  
|                 | char txt[11];  
|                 | ...  
|                 | LongToStr(jj, txt);  
|                 | // txt is "   3700000" (three blanks here) |
**FloatToStr**

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned char FloatToStr(float fnum, unsigned char *str);</code></th>
</tr>
</thead>
</table>
| Returns   | - 3 if input number is NaN  
- 2 if input number is -INF  
- 1 if input number is +INF  
- 0 if conversion was successful |
| Description | Converts a floating point number to a string.  

Parameters:  
- input: floating point number to be converted  
- output: destination string  

The output string is left justified and null terminated after the last digit.  

**Note:** Given floating point number will be truncated to 7 most significant digits before conversion.  

<table>
<thead>
<tr>
<th>Requires</th>
<th>Destination string should be at least 14 characters in length.</th>
</tr>
</thead>
</table>
| Example  | `float ff1 = -374.2;  
float ff2 = 123.456789;  
float ff3 = 0.000001234;  
char txt[15];  
...  
FloatToStr(ff1, txt); // txt is "-374.2"  
FloatToStr(ff2, txt); // txt is "123.4567"  
FloatToStr(ff3, txt); // txt is "1.234e-6"` |
### Dec2Bcd

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned short Dec2Bcd(unsigned short decnum);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Converted BCD value.</td>
</tr>
<tr>
<td>Description</td>
<td>Converts input unsigned short integer number to its appropriate BCD representation.</td>
</tr>
<tr>
<td>Parameters:</td>
<td>- <code>decnum</code>: unsigned short integer number to be converted</td>
</tr>
<tr>
<td>Requires</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Example</td>
<td><code>unsigned short a, b;</code></td>
</tr>
<tr>
<td></td>
<td><code>...</code></td>
</tr>
<tr>
<td></td>
<td><code>a = 22;</code></td>
</tr>
<tr>
<td></td>
<td><code>b = Dec2Bcd(a);  // b equals 34</code></td>
</tr>
</tbody>
</table>

### Bcd2Dec16

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>unsigned Bcd2Dec16(unsigned bcdnum);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Converted decimal value.</td>
</tr>
<tr>
<td>Description</td>
<td>Converts 16-bit BCD numeral to its decimal equivalent.</td>
</tr>
<tr>
<td>Parameters:</td>
<td>- <code>bcdnum</code>: 16-bit BCD numeral to be converted</td>
</tr>
<tr>
<td>Requires</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Example</td>
<td><code>unsigned a, b;</code></td>
</tr>
<tr>
<td></td>
<td><code>...</code></td>
</tr>
<tr>
<td></td>
<td><code>a = 0x1234;  // a equals 4660</code></td>
</tr>
<tr>
<td></td>
<td><code>b = Bcd2Dec16(a);  // b equals 1234</code></td>
</tr>
</tbody>
</table>
## Dec2Bcd16

<table>
<thead>
<tr>
<th>Prototype</th>
<th>unsigned Dec2Bcd16(unsigned decnum);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Converted BCD value.</td>
</tr>
<tr>
<td>Description</td>
<td>Converts unsigned 16-bit decimal value to its BCD equivalent.</td>
</tr>
<tr>
<td>Parameters:</td>
<td>- decnum unsigned 16-bit decimal number to be converted</td>
</tr>
<tr>
<td>Requires</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Example</td>
<td>unsigned a, b;</td>
</tr>
<tr>
<td></td>
<td>...</td>
</tr>
<tr>
<td></td>
<td>a = 2345;</td>
</tr>
<tr>
<td></td>
<td>b = Dec2Bcd16(a); // b equals 9029</td>
</tr>
</tbody>
</table>
**PRINTOUT LIBRARY**

The *mikroC PRO for PIC* provides the PrintOut routine for easy data formatting and printing.

*Note*: Library works with PIC18 family only.

**Library Routines**

- PrintOut

**PrintOut**

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void PrintOut(void (*prntoutfunc)(char ch), const char *f,...);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing.</td>
</tr>
</tbody>
</table>

`PrintOut` is used to format data and print them in a way defined by the user through a print handler function.

Parameters:

- `prntoutfunc`: print handler function
- `f`: format string

The `f` argument is a format string and may be composed of characters, escape sequences, and format specifications. Ordinary characters and escape sequences are copied to the print handler in order in which they are interpreted. Format specifications always begin with a percent sign (%) and require additional arguments to be included in the function call.

The format string is read from left to right. The first format specification encountered refers to the first argument after the `f` parameter and then converts and outputs it using the format specification. The second format specification accesses the second argument after `f`, and so on. If there are more arguments than format specifications, the extra arguments are ignored. Results are unpredictable if there are not enough arguments for the format specifications. The format specifications have the following format:

```
% [flags] [width] [.precision] [{ l | L }] conversion_type
```

Each field in the format specification can be a single character or a number which specifies a particular format option. The `conversion_type` field is where a single character specifies that an argument is interpreted as a character, string, number, or pointer, as shown in the following table:
<table>
<thead>
<tr>
<th>conversion_type</th>
<th>Argument Type</th>
<th>Output Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>d</td>
<td>int</td>
<td>Signed decimal number</td>
</tr>
<tr>
<td>u</td>
<td>unsigned int</td>
<td>Unsigned decimal number</td>
</tr>
<tr>
<td>o</td>
<td>unsigned int</td>
<td>Unsigned octal number</td>
</tr>
<tr>
<td>x</td>
<td>unsigned int</td>
<td>Unsigned hexadecimal number using 0123456789abcdef</td>
</tr>
<tr>
<td>X</td>
<td>unsigned int</td>
<td>Unsigned hexadecimal number using 0123456789ABCEDF</td>
</tr>
<tr>
<td>f</td>
<td>double</td>
<td>Floating-point number using the format [-]dddd.dddd</td>
</tr>
<tr>
<td>e</td>
<td>double</td>
<td>Floating-point number using the format [-]d.ddde[-]dd</td>
</tr>
<tr>
<td>E</td>
<td>double</td>
<td>Floating-point number using the format [-]d.ddde[-]dd</td>
</tr>
<tr>
<td>g</td>
<td>double</td>
<td>Floating-point number using either e or f format, whichever is more compact for the specified value and precision</td>
</tr>
<tr>
<td>c</td>
<td>int</td>
<td>Int is converted to an unsigned char, and the resulting character is written</td>
</tr>
<tr>
<td>s</td>
<td>char *</td>
<td>String with a terminating null character</td>
</tr>
<tr>
<td>p</td>
<td>void *</td>
<td>Pointer value, the X format is used</td>
</tr>
<tr>
<td>%</td>
<td>&lt;none&gt;</td>
<td>A % is written. No argument is converted. The complete conversion specification shall be %%.</td>
</tr>
</tbody>
</table>
The **flags** field is where a single character is used to justify the output and to print +/- signs and blanks, decimal points, and octal and hexadecimal prefixes, as shown in the following table.

<table>
<thead>
<tr>
<th>flags</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>+</td>
<td>Left justify the output in the specified field width.</td>
</tr>
<tr>
<td>-</td>
<td>Prefix the output value with + or - sign if the output is a signed type.</td>
</tr>
<tr>
<td>space ( ' ' )</td>
<td>Prefix the output value with a blank if it is a signed positive value. Otherwise, no blank is prefixed.</td>
</tr>
<tr>
<td>#</td>
<td>Prefix a non-zero output value with 0, 0x, or 0X when used with o, x, and X field types, respectively. When used with the e, E, f, g, and G field types, the # flag forces the output value to include a decimal point. In any other case the # flag is ignored.</td>
</tr>
<tr>
<td>*</td>
<td>Ignore format specifier.</td>
</tr>
</tbody>
</table>

The **width** field is a non-negative number that specifies a minimum number of printed characters. If a number of characters in the output value is less than width, blanks are added on the left or right (when the - flag is specified) in order to pad to the minimum width. If the width is prefixed with 0, then zeros are padded instead of blanks. The width field never truncates a field. If the length of the output value exceeds the specified width, all characters are output.

The **precision** field is a non-negative number that specifies the number of characters to print, number of significant digits, or number of decimal places. The precision field can cause truncation or rounding of the output value in the case of a floating-point number as specified in the following table.

<table>
<thead>
<tr>
<th>flags</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>d, u, o, x, X</td>
<td>The precision field is where you specify the minimum number of digits that will be included in the output value. Digits are not truncated if the number of digits in an argument exceeds that defined in the precision field. If the number of digits in the argument is less than the precision field, the output value is padded on the left with zeros.</td>
</tr>
<tr>
<td>f</td>
<td>The precision field is where you specify the number of digits to the right of the decimal point. The last digit is rounded.</td>
</tr>
<tr>
<td>e, E</td>
<td>The precision field is where you specify the number of digits to the right of the decimal point. The last digit is rounded.</td>
</tr>
<tr>
<td>g</td>
<td>The precision field is where you specify the maximum number of significant digits in the output value.</td>
</tr>
<tr>
<td>c, C</td>
<td>The precision field has no effect on these field types.</td>
</tr>
<tr>
<td>s</td>
<td>The precision field is where you specify the maximum number of characters in the output value. Excess characters are not output.</td>
</tr>
<tr>
<td>Description</td>
<td>The optional characters <code>l</code> or <code>L</code> may immediately precede <code>conversion_type</code> to respectively specify long versions of the integer types <code>d, i, u, o, x</code>, and <code>X</code>. You must ensure that the argument type matches that of the format specification. You can use type casts to ensure that the proper type is passed to <code>print-out</code>.</td>
</tr>
<tr>
<td>Requires</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Example</td>
<td>Print mikroElektronika example's header file to UART.</td>
</tr>
</tbody>
</table>

```c
void PrintHandler(char c)
{
    UART1_Write(c);
}

void main()
{
    UART1_Init(9600);
    Delay_ms(100);

    PrintOut(PrintHandler, "/\n"

```
**SETJMP LIBRARY**

This library contains functions and types definitions for bypassing the normal function call and return discipline. The type declared is `jmp_buf` which is an array type suitable for holding the information needed to restore a calling environment.

Type declaration is contained in sejmp16.h and setjmp18.h header files for PIC16 and PIC18 family mcus respectively. These headers can be found in the include folder of the compiler. The implementation of this library is different for PIC16 and PIC18 family mcus. For PIC16 family `Setjmp` and `Longjmp` are implemented as macros defined in setjmp16.h header file and for PIC18 family as functions defined in setjmp library file.

Note: Due to PIC16 family specific of not being able to read/write stack pointer, the program execution after `Longjmp` invocation occurs depends on the stack content. That is why, for PIC16 family only, implementation of `Setjmp` and `Longjmp` functions is not ANSI C standard compliant.

**Library Routines**

- `Setjmp`
- `Longjmp`

**Setjmp**

<table>

### Longjmp

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>void longjmp(jmp_buf env, int val);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Longjmp causes <code>setjmp</code> to return <code>val</code>, if <code>val</code> is 0 it will return 1.</td>
</tr>
<tr>
<td>Description</td>
<td>Restores calling environment saved in <code>jmp_buf</code> by most recent invocation of <code>setjmp</code> macro. If there has been no such invocation, or function containing the invocation of <code>setjmp</code> has terminated in the interim, the behavior is undefined. Parameter <code>env</code>: array of type <code>(jmp_buf)</code> holding the information saved by corresponding <code>setjmp</code> invocation, <code>val</code>: char value, that will return corresponding <code>setjmp</code>.</td>
</tr>
<tr>
<td>Requires</td>
<td>Invocation of <code>Longjmp</code> must occur before return from the function in which <code>Setjmp</code> was called encounters.</td>
</tr>
<tr>
<td>Example</td>
<td><code>longjmp(buf, 2);</code></td>
</tr>
</tbody>
</table>
Library Example

Example demonstrates function cross calling using setjmp and longjmp functions. When called, Setjmp() saves its calling environment in its jmp_buf argument for later use by the Longjmp(). Longjmp(), on the other hand, restores the environment saved by the most recent invocation of the Setjmp() with the corresponding jmp_buf argument. The given example is for P16.

```c
#include <Setjmp16.h>

jmp_buf buf;       // Note: Program flow diagrams are indexed
                    // to the sequence of execution

void func33(){       //  2<----------|
    asm nop;            //              |
    longjmp(buf, 2);       //  3-------------->|
    asm nop;            //              |   |
}                      //              |   |

void func(){         //  1<------ |   |   |
    portb = 3;            //          |   |   |
    if (setjmp(buf) == 2) //  3<--------------|
        portb = 1;          //  4-->|   |   |
    else                    //  4<--|   |
        func33();           //  2---------->|
    asm nop;              //      |   |
}                      // 5-------|------>depends on stack content

void main() {         //          |
    PORTB = 0;            //          |
    TRISB = 0;            //          |
    asm nop;              //          |
    func();               //  1------>|
    asm nop;              //          |
}
SPRINT LIBRARY

The mikroC PRO for PIC provides the standard ANSI C Sprintf function for easy data formatting.

Note: In addition to ANSI C standard, the Sprint Library also includes two limited versions of the sprintf function (sprinti and sprintl). These functions take less ROM and RAM and may be more convenient for use in some cases.

Functions

- sprintf
- sprintl
- sprinti

sprintf

Prototype

```
sprintf(char *wh, const char *f,...);
```

Returns

The function returns the number of characters actually written to destination string.

Description

```
sprintf is used to format data and print them into destination string.

Parameters:
- wh: destination string
- f: format string

The f argument is a format string and may be composed of characters, escape sequences, and format specifications. Ordinary characters and escape sequences are copied to the destination string in the order in which they are interpreted. Format specifications always begin with a percent sign (%) and require additional arguments to be included in the function call.

The format string is read from left to right. The first format specification encountered refers to the first argument after f and then converts and outputs it using the format specification. The second format specification accesses the second argument after f, and so on. If there are more arguments than format specifications, then these extra arguments are ignored. Results are unpredictable if there are not enough arguments for the format specifications. The format specifications have the following format:

```
% [flags] [width] [.precision] [{ l | L }] conversion_type
```
```
Each field in the format specification can be a single character or a number which specifies a particular format option. The `conversion_type` field is where a single character specifies that the argument is interpreted as a character, string, number, or pointer, as shown in the following table:

<table>
<thead>
<tr>
<th><code>conversion_type</code></th>
<th>Argument Type</th>
<th>Output Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>d</td>
<td>int</td>
<td>Signed decimal number</td>
</tr>
<tr>
<td>u</td>
<td>unsigned int</td>
<td>Unsigned decimal number</td>
</tr>
<tr>
<td>o</td>
<td>unsigned int</td>
<td>Unsigned octal number</td>
</tr>
<tr>
<td>x</td>
<td>unsigned int</td>
<td>Unsigned hexadecimal number using 0123456789abcdef</td>
</tr>
<tr>
<td>X</td>
<td>unsigned int</td>
<td>Unsigned hexadecimal number using 0123456789ABCEDF</td>
</tr>
<tr>
<td>f</td>
<td>double</td>
<td>Floating-point number using the format [-]dddd.dddd</td>
</tr>
<tr>
<td>e</td>
<td>double</td>
<td>Floating-point number using the format [-]d.dddde[-]dd</td>
</tr>
<tr>
<td>E</td>
<td>double</td>
<td>Floating-point number using the format [-]d.dddE[-]dd</td>
</tr>
<tr>
<td>g</td>
<td>double</td>
<td>Floating-point number using either e or f format, whichever is more compact for the specified value and precision</td>
</tr>
<tr>
<td>c</td>
<td>int</td>
<td>int is converted to an <code>unsigned char</code>, and the resulting character is written</td>
</tr>
<tr>
<td>s</td>
<td>char *</td>
<td>String with a terminating null character</td>
</tr>
<tr>
<td>p</td>
<td>void *</td>
<td>Pointer value, the X format is used</td>
</tr>
<tr>
<td>%</td>
<td>&lt;none&gt;</td>
<td>A % is written. No argument is converted. The complete conversion specification shall be %%.</td>
</tr>
</tbody>
</table>
The flags field is where a single character is used to justify the output and to print +/- signs and blanks, decimal points, and octal and hexadecimal prefixes, as shown in the following table.

<table>
<thead>
<tr>
<th>flags</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>+</td>
<td>Left justify the output in the specified field width.</td>
</tr>
<tr>
<td>-</td>
<td>Prefix the output value with + or - sign if the output is a signed type.</td>
</tr>
<tr>
<td>space (' ')</td>
<td>Prefix the output value with a blank if it is a signed positive value. Otherwise, no blank is prefixed.</td>
</tr>
<tr>
<td>#</td>
<td>Prefix a non-zero output value with 0, 0x, or 0X when used with o, x, and x field types, respectively. When used with the e, E, f, g, and G field types, the # flag forces the output value to include a decimal point. In any other case the # flag is ignored.</td>
</tr>
<tr>
<td>*</td>
<td>Ignore format specifier.</td>
</tr>
</tbody>
</table>

The width field is a non-negative number that specifies a minimum number of printed characters. If a number of characters in the output value is less than width, blanks are added on the left or right (when the - flag is specified) in order to pad to the minimum width. If the width is prefixed with 0, then zeros are padded instead of blanks. The width field never truncates a field. If the length of the output value exceeds the specified width, all characters are output.

The precision field is a non-negative number that specifies the number of characters to print, number of significant digits, or number of decimal places. The precision field can cause truncation or rounding of the output value in the case of a floating-point number as specified in the following table.

<table>
<thead>
<tr>
<th>flags</th>
<th>Meaning of the precision field</th>
</tr>
</thead>
<tbody>
<tr>
<td>d, u, o, x, X</td>
<td>The precision field is where you specify the minimum number of digits that will be included in the output value. Digits are not truncated if the number of digits in an argument exceeds that defined in the precision field. If the number of digits in the argument is less than the precision field, the output value is padded on the left with zeros.</td>
</tr>
<tr>
<td>f</td>
<td>The precision field is where you specify the number of digits to the right of the decimal point. The last digit is rounded.</td>
</tr>
<tr>
<td>e, E</td>
<td>The precision field is where you specify the number of digits to the right of the decimal point. The last digit is rounded.</td>
</tr>
<tr>
<td>g</td>
<td>The precision field is where you specify the maximum number of significant digits in the output value.</td>
</tr>
<tr>
<td>c, C</td>
<td>The precision field has no effect on these field types.</td>
</tr>
<tr>
<td>s</td>
<td>The precision field is where you specify the maximum number of characters in the output value. Excess characters are not output.</td>
</tr>
</tbody>
</table>
The optional characters `l` or `L` may immediately precede `conversion_type` to respectively specify long versions of the integer types `d`, `i`, `u`, `o`, `x`, and `X`. You must ensure that the argument type matches that of the format specification. You can use type casts to ensure that the proper type is passed to `sprintf`.

**sprintl**

**Prototype**

```c
sprintl(char *wh, const char *f,...);
```

**Returns**

The function returns the number of characters actually written to destination string.

**Description**

The same as `sprintf`, except it doesn't support float-type numbers.

---

**sprinti**

**Prototype**

```c
sprinti(char *wh, const char *f,...);
```

**Returns**

The function returns the number of characters actually written to destination string.

**Description**

The same as `sprintf`, except it doesn't support long integers and float-type numbers.
Library Example

This is a demonstration of the standard C library sprintf routine usage. Three different representations of the same floating point number obtained by using the sprintf routine are sent via UART.

```c
#include <stdio.h>

double ww = -1.2587538e+1;
char buffer[15];

// Function for sending string to UART
void UartWriteText(char *txt) {
    while (*txt)
        UART1_Write(*txt++);
}

// Function for sending const string to UART
void UartWriteConstText(const char *txt) {
    while (*txt)
        UART1_Write(*txt++);
}

void main(){
    UART1_Init(4800);          // Initialize UART module at 4800 bps
    Delay_ms(10);

    UartWriteConstText("Floating point number representation"); // Write message on UART
    printf(buffer, "%12e", ww);   // Format ww and store it to buffer
    UartWriteConstText("\n\ne format:");     // Write message on UART
    UartWriteText(buffer);                   // Write buffer on UART

    printf(buffer, "%12f", ww);   // Format ww and store it to buffer
    UartWriteConstText("\n\nf format:");     // Write message on UART
    UartWriteText(buffer);                   // Write buffer on UART

    printf(buffer, "%12g", ww);   // Format ww and store it to buffer
    UartWriteConstText("\n\ng format:");     // Write message on UART
    UartWriteText(buffer);                   // Write buffer on UART
}
```
TIME LIBRARY

The Time Library contains functions and type definitions for time calculations in the UNIX time format which counts the number of seconds since the "epoch". This is very convenient for programs that work with time intervals: the difference between two UNIX time values is a real-time difference measured in seconds.

What is the epoch?
Originally it was defined as the beginning of 1970 GMT. (January 1, 1970 Julian day) GMT, Greenwich Mean Time, is a traditional term for the time zone in England.

The TimeStruct type is a structure type suitable for time and date storage. Type declaration is contained in timelib.h which can be found in the mikroC PRO for PIC Time Library Demo example folder.

Library Routines
- Time_dateToEpoch
- Time_epochToDate
- Time_dateDiff
### Time_dateToEpoch

**Prototype**

```c
long Time_dateToEpoch(TimeStruct *ts);
```

**Returns**

Number of seconds since January 1, 1970 0h00mn00s.

**Description**

This function returns the unix time: number of seconds since January 1, 1970 0h00mn00s.

**Parameters:**

- `ts`: time and date value for calculating unix time.

**Requires**

Nothing.

**Example**

```c
#include       "timelib.h"
...
TimeStruct  ts1;
long        epoch;
...

/*
 * what is the epoch of the date in ts ?
 */
epoch = Time_dateToEpoch(&ts1);
```

### Time_epochToDate

**Prototype**

```c
void Time_epochToDate(long e, TimeStruct *ts);
```

**Returns**

Nothing.

**Description**

Converts the unix time to time and date.

**Parameters:**

- `e`: unix time (seconds since unix epoch)
- `ts`: time and date structure for storing conversion output

**Requires**

Nothing.

**Example**

```c
#include       "timelib.h"
...
TimeStruct  ts2;
long        epoch;
...

/*
 * what date is epoch 1234567890 ?
 */
epoch = 1234567890;
Time_epochToDate(epoch, &ts2);
```
# Time_dateDiff

<table>
<thead>
<tr>
<th>Prototype</th>
<th>long Time_dateDiff(TimeStruct *t1, TimeStruct *t2);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Time difference in seconds as a signed long.</td>
</tr>
</tbody>
</table>
| Description     | This function compares two dates and returns time difference in seconds as a signed long. Result is positive if t1 is before t2, result is null if t1 is the same as t2 and result is negative if t1 is after t2. Parameters:  
- t1: time and date structure (the first comparison parameter)  
- t2: time and date structure (the second comparison parameter)  
Note: This function is implemented as macro in the timelib.h header file which can be found in the mikroC PRO for PIC Time Library Demo example folder. |
| Requires        | Nothing.                                            |
| Example         | #include "timelib.h"  
...  
TimeStruct t1, t2;  
long diff;  
...  
/*  
 * how many seconds between these two dates contained in t1 and t2 buffers?  
*/  
diff = Time_dateDiff(&t1, &t2); |
Library Example

This example demonstrates Time Library usage.

```c
#include "timelib.h"

TimeStruct ts1, ts2;
long epoch;
long diff;

void main() {
  ts1.ss = 0;
  ts1.mn = 7;
  ts1.hh = 17;
  ts1.md = 23;
  ts1.mo = 5;
  ts1.yy = 2006;

  /*
   * What is the epoch of the date in ts ?
   */
  epoch = Time_dateToEpoch(&ts1);

  /*
   * What date is epoch 1234567890 ?
   */
  epoch = 1234567890;
  Time_epochToDate(epoch, &ts2);

  /*
   * How much seconds between this two dates ?
   */
  diff = Time_dateDiff(&ts1, &ts2);
}
```
TRIGONOMETRY LIBRARY

The *mikroC PRO for PIC* implements fundamental trigonometry functions. These functions are implemented as look-up tables. Trigonometry functions are implemented in integer format in order to save memory.

Library Routines

- sinE3
- cosE3

**sinE3**

<table>
<thead>
<tr>
<th>Prototype</th>
<th><code>int sinE3(unsigned angle_deg);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>The function returns the sine of input parameter.</td>
</tr>
<tr>
<td>Description</td>
<td>The function calculates sine multiplied by 1000 and rounded to the nearest integer:</td>
</tr>
<tr>
<td></td>
<td><code>result := round(sin(angle_deg)*1000)</code></td>
</tr>
<tr>
<td>Parameters:</td>
<td>- <code>angle_deg</code>: input angle in degrees</td>
</tr>
<tr>
<td>Note:</td>
<td>Return value range: -1000..1000.</td>
</tr>
<tr>
<td>Requires</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Example</td>
<td><code>int res;</code></td>
</tr>
<tr>
<td></td>
<td><code>...</code></td>
</tr>
<tr>
<td></td>
<td><code>res = sinE3(45); // result is 707</code></td>
</tr>
</tbody>
</table>
## cosE3

<table>
<thead>
<tr>
<th>Prototype</th>
<th>int cosE3(unsigned angle_deg);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>The function returns the cosine of input parameter.</td>
</tr>
</tbody>
</table>
| Description     | The function calculates cosine multiplied by 1000 and rounded to the nearest integer:
|                  | result := round(cos(angle_deg)*1000) |
| Parameters:     | angle_deg: input angle in degrees |
| Note:           | Return value range: -1000..1000. |
| Requires        | Nothing. |
| Example         | int res;
|                  | ... |
|                  | res = cosE3(196); // result is -193 |
